

**Chinese SONG
and new Site
for future astronomy in China**

Licai Deng

National Astronomical Observatories, CAS

Tenerife, Oct 2018

Contents

- Chinese SONG: Done and to be done
 - Brief report for 2013-1018
 - Issues with the system
- SONG and existing sites in the west
- Current site: protection vs fast development
- The need for new sites: Chinese mega-science plans
- Site qualification at LENGHU.

Current SONG @Delingha

- Shuttled down spring 2018 for a major maintenance after about 132hr 'manned' observations mainly in 2017
 - Removing secondary unit, recoating and replace the support (hexapod -> linear focusing only)
 - Re-cabling the system (which has been a mess even for regular operations)
 - Realigning all the optics
 - Sorting out solar fiber feed
 - Maintenance of the spectrograph (the best part of the system)
- Still working on most of above tasks

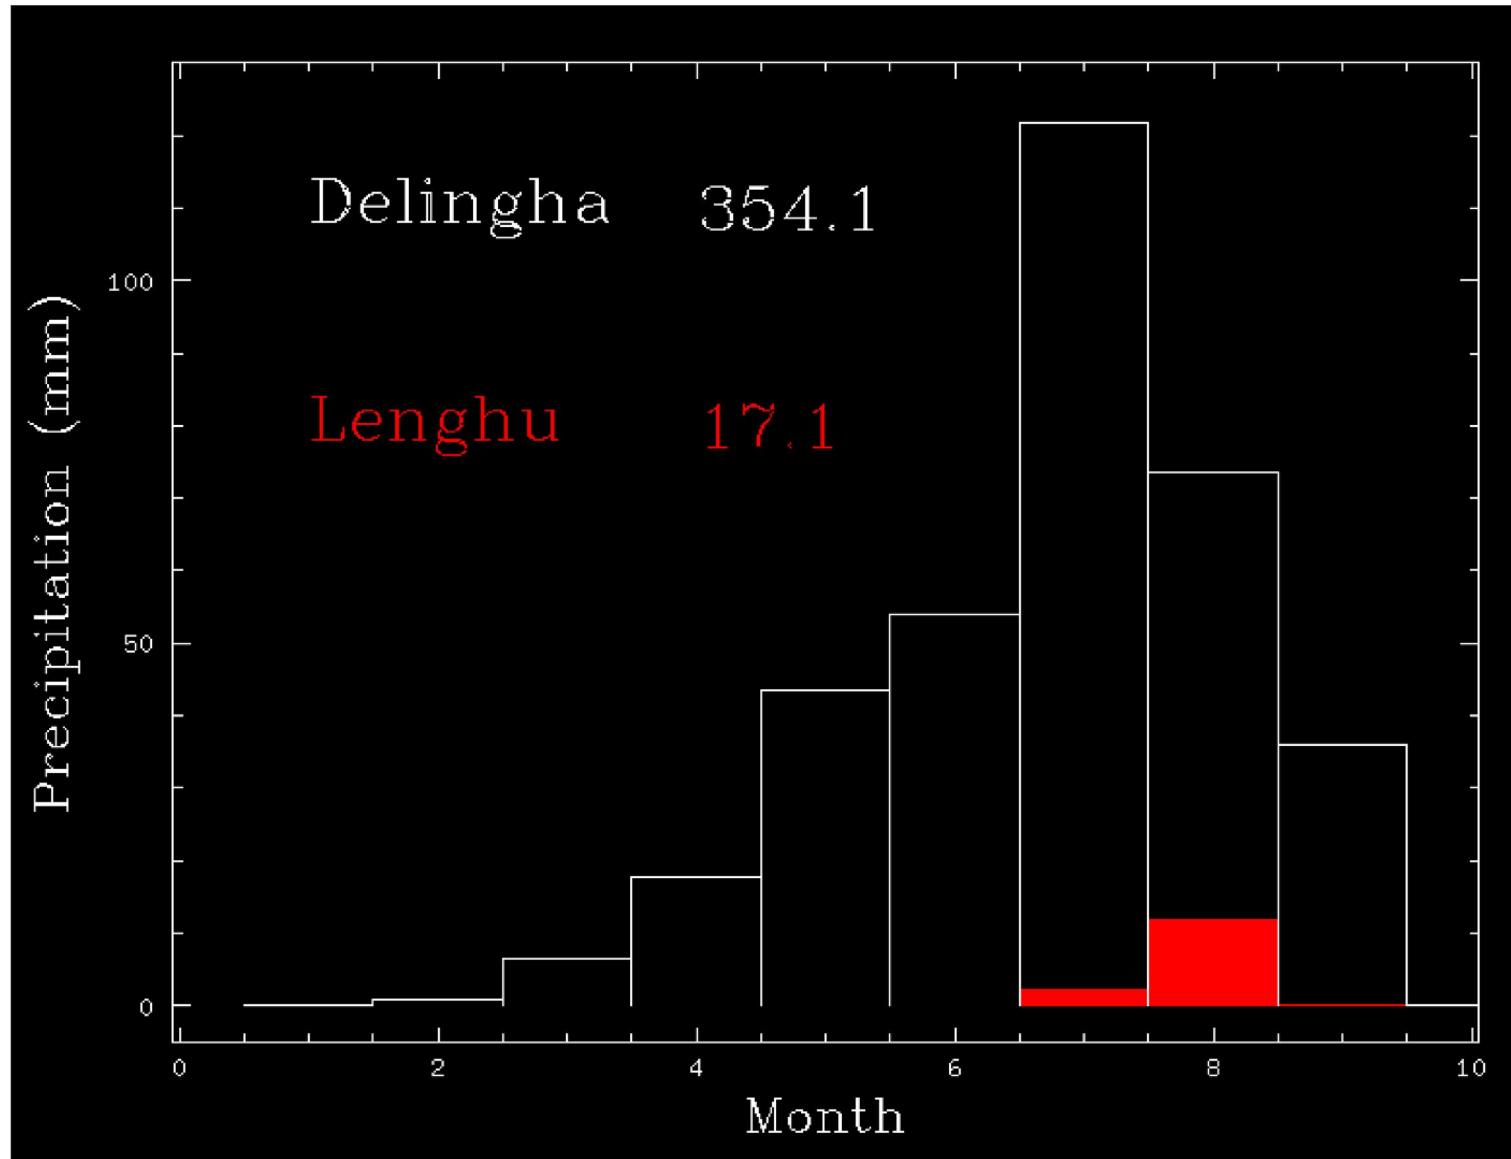

Secondary support

Delingha site quality keep decaying since 2014

- The city is brightening up exponentially at night (local development and touristic activities)
- Direct light pollution reaching the Zenith at the site (shooting entertainment laser beams)
- Agricultural activities reaches 10 meter away from our facility
- Abnormal climate change, rain like in Yangzi area
- But these are not the reason for relocating SONG

Precipitation: DLH vs LH

New site, opportunity for SONG

- 12 meter LOT project
- 6.5 meter, side project of Tianqin, a G-wave detection mega-science project by Sunyisian' University
- Local government at Lenghu is promoting development plan:
 - using Starry sky and spectacular landscape as the main attractions
 - Night sky protection will be enforced at the whole district (by a law - to be approved)
 - Providing funding for site survey and **relocating SONG!**

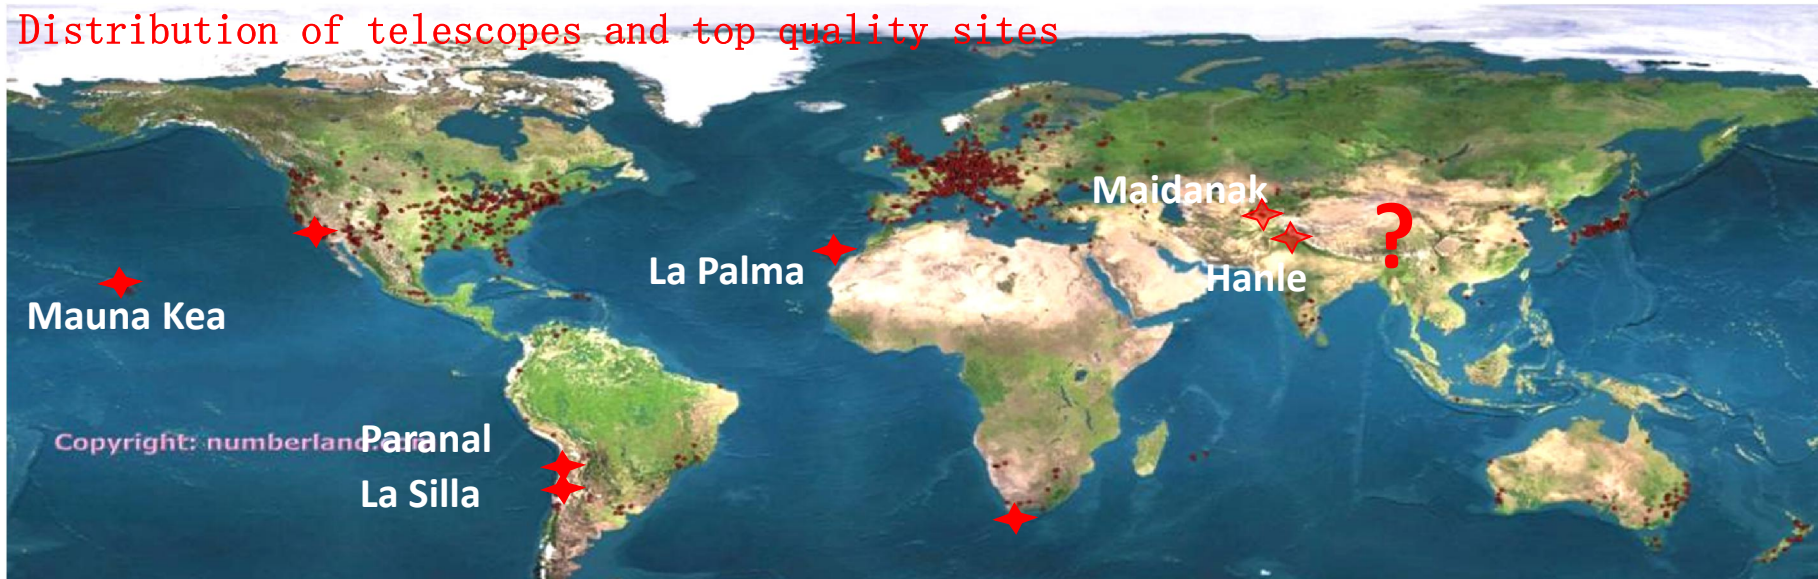

Site resource world wide

Low cloud coverage, low atmospheric turbulence, low extinction

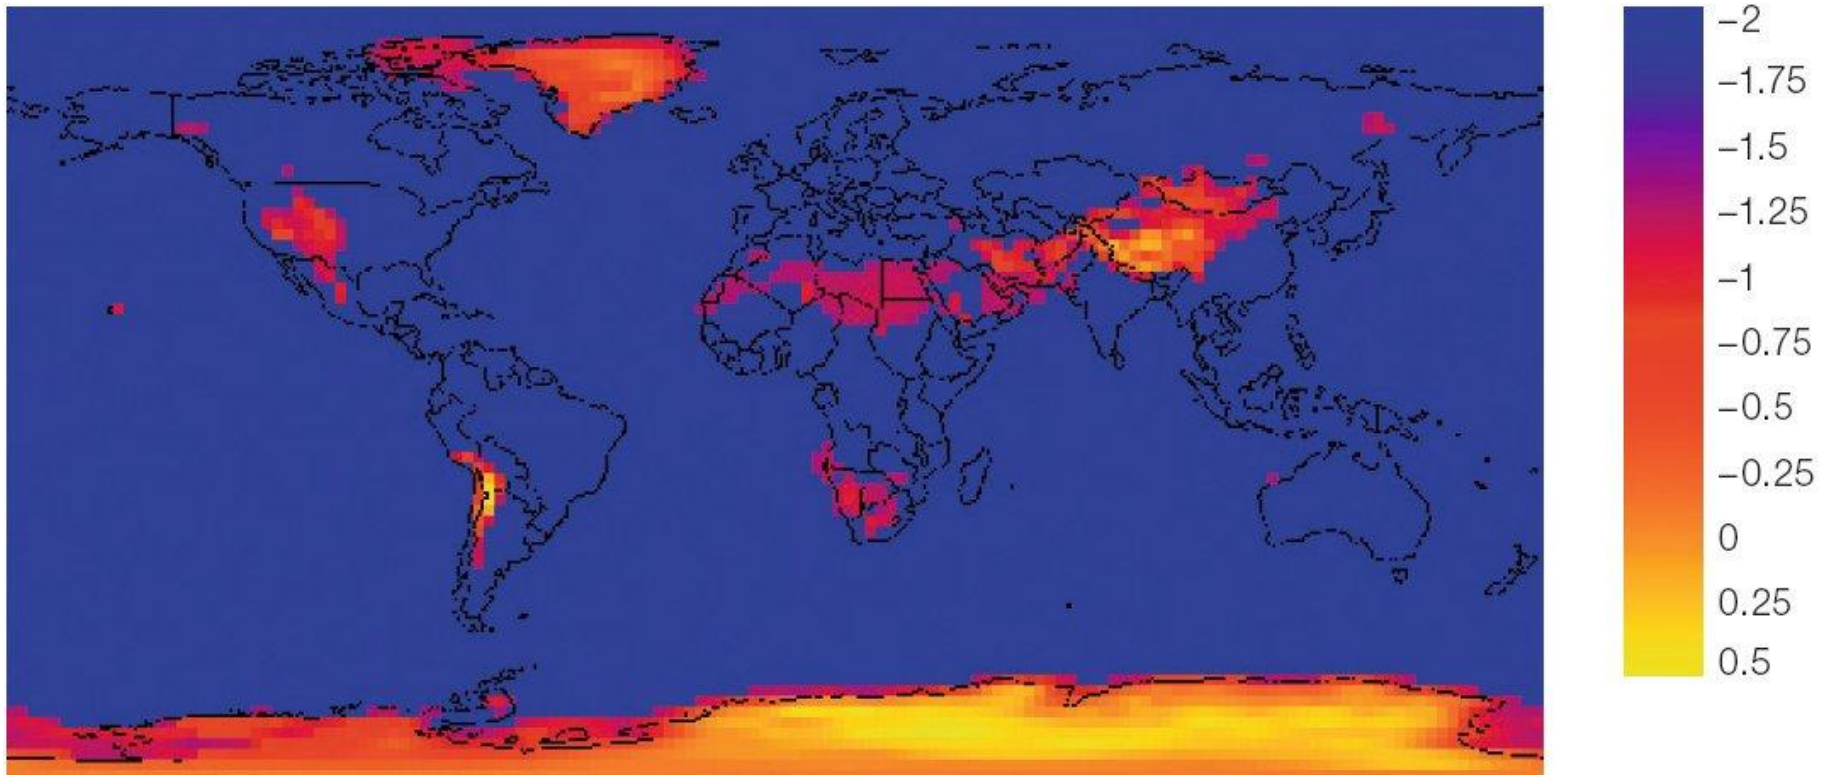

Distribution of telescopes and top quality sites

Global satellite view

Marc Sarazin et al. 2006

FriOWL: A Site Selection Tool for the E-ELT Project

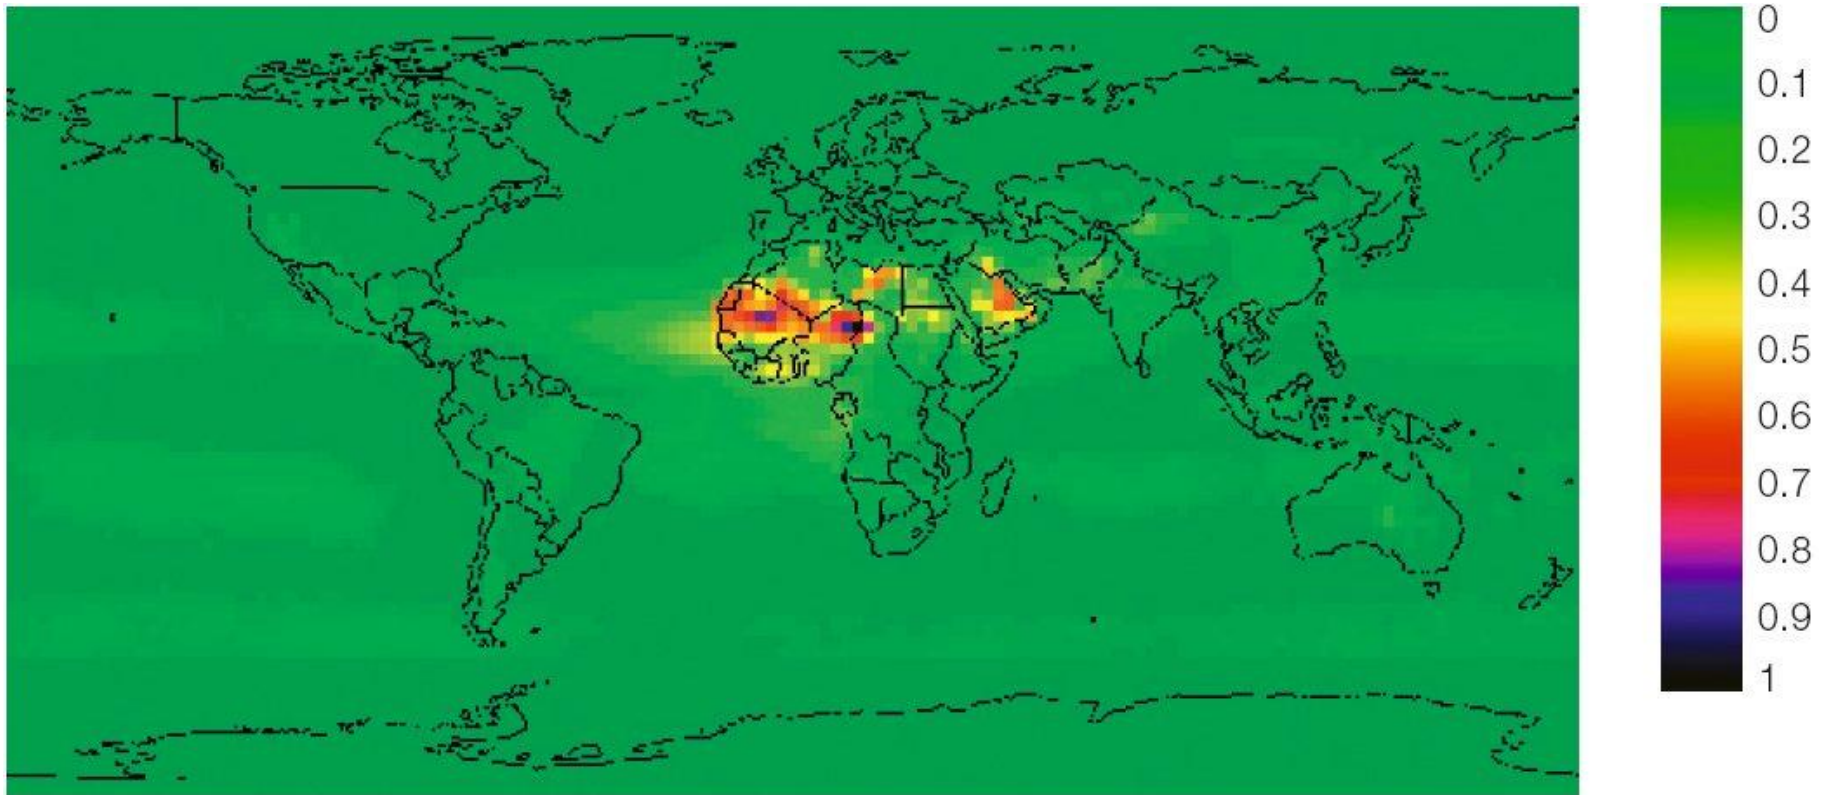

Overlay distinguishing areas providing high summits and low cloudiness as well as low PWV, 2.5 degree square pixels.

Sand problem

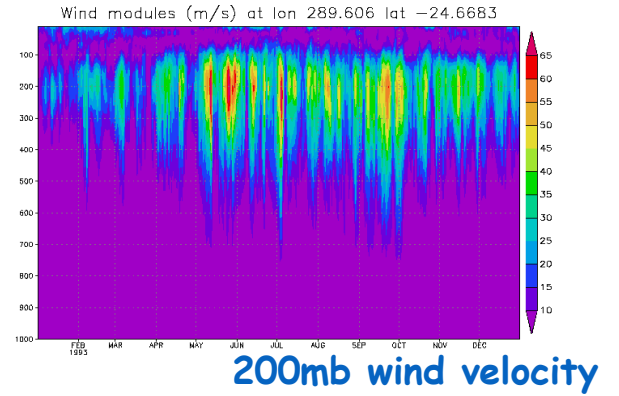

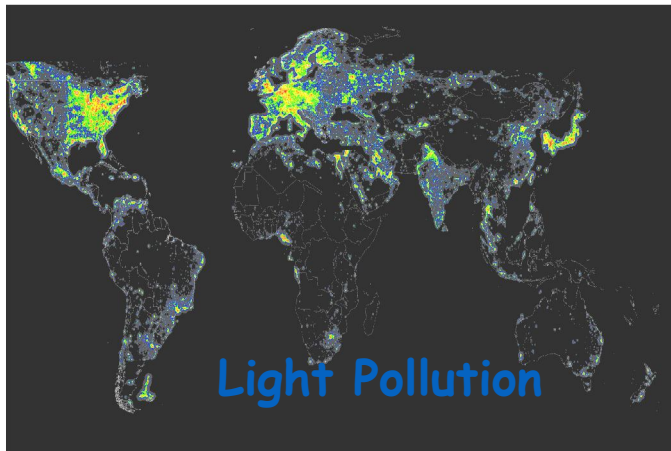

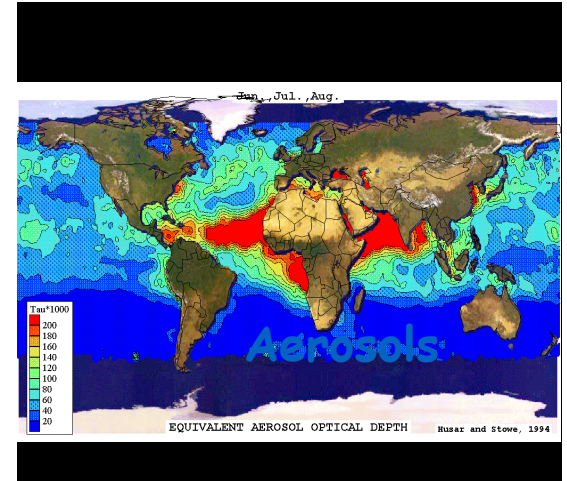

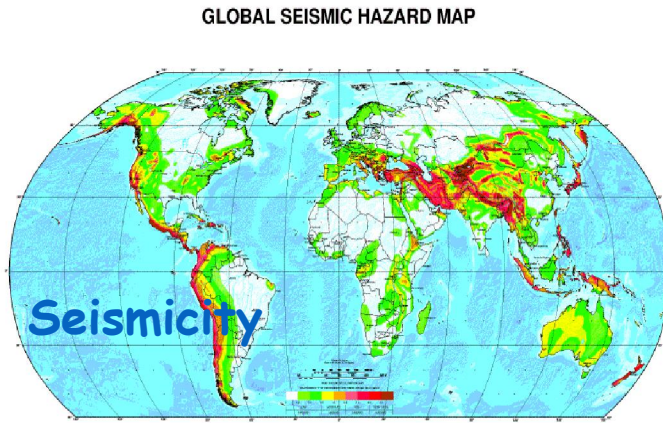

Marc Sarazin et al. 2006

FriOWL: A Site Selection Tool for the E-ELT Project

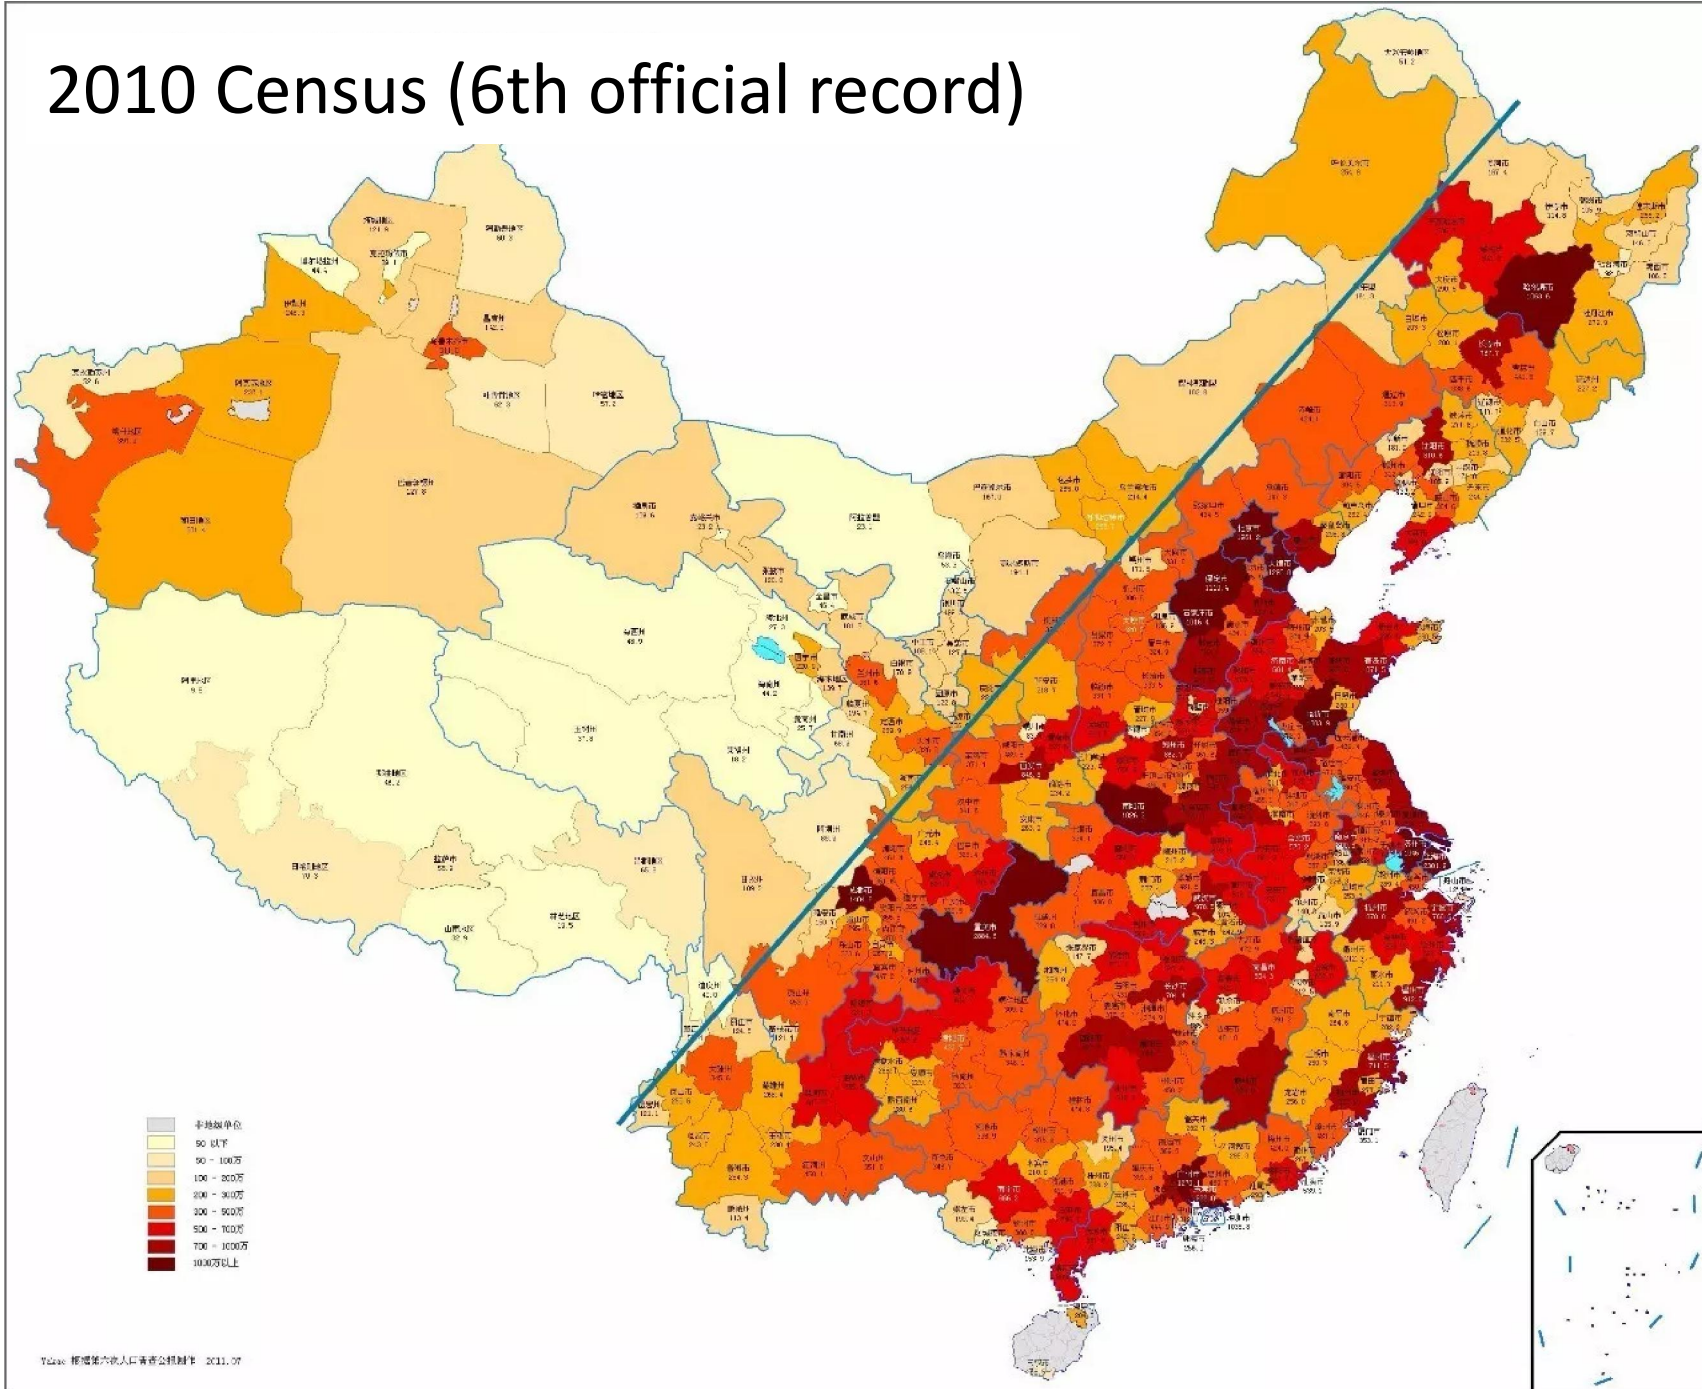

Mean aerosol index as measured by TOMS UV satellite for the period 1980-2002.

Geographical Information Systems (GIS)

Why going on to the plateau?

2010 Census (6th official record)

10 year meteorological data

- 3 local weather station LH、DFS、MHH
- Each has temperature, humidity, wind speed and direction
- Statistical analysis
- Wind rose, 10min average

感谢冷湖气象站樊万珍!

WS @Lenghu: temperature

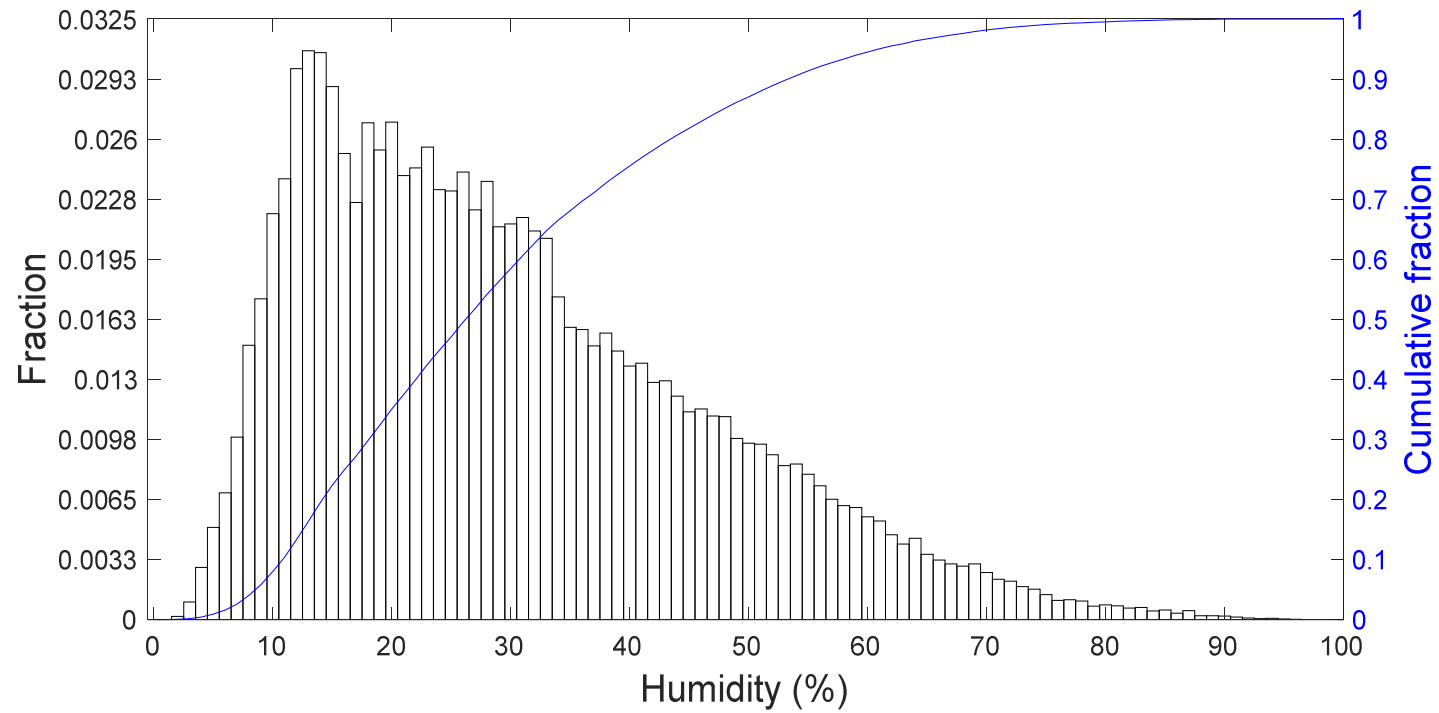

LH: Max = 34.9 min = -30.9 median = 4.9 mean = 4.1

WS @Lenghu: Relative Humidity

LH: Max = 96 min = 2 median = 27 mean = 29

WS @Lenghu: Humidity distribution

LH: median = 27

WS @Lenghu: Wind speed

LH: median = 2.7 max = 21.4

WS @Lenghu: Wind Rose

LH

Following Delingha (SONG site), to be done:

- ~~Historic weather record~~
- ~~Weather data from stations~~
- **Sky background stats**
- **Av. Annual Cloudiness (observing time assessment)**
- **Seeing (making sense only at the actual site)**
- **Higher standard for Large T.!**

Site qualification measures

- Power: Solar panels + inverter 3KW X2, good for all instruments including DIMM, regular running start Feb.
- All sky cam: regular operation only after Mar.
- Sky brightness (SQM)
- Weather station (Wind speed and direction, pressure, temperature, humidity)
- Other instruments: Mass-DIMM, SNIDAR

Zodiacal light at Sun set

First human footprint at the site

Max scale 20 (m/s)

Sky quality assessment by SQM

- SQM facts:
 - Wide band ($\sim B+V$), wide sampling angle ($15^\circ/30^\circ$), output mag/seqdeg (well calibrated), accr.0.01m
 - Industrial product (identical/stable/durable/ data recording)
- Sky brightness is very sensitive to cloud passage!
- Time series data is good for night quality analysis, basics available from Unihedron's homepage

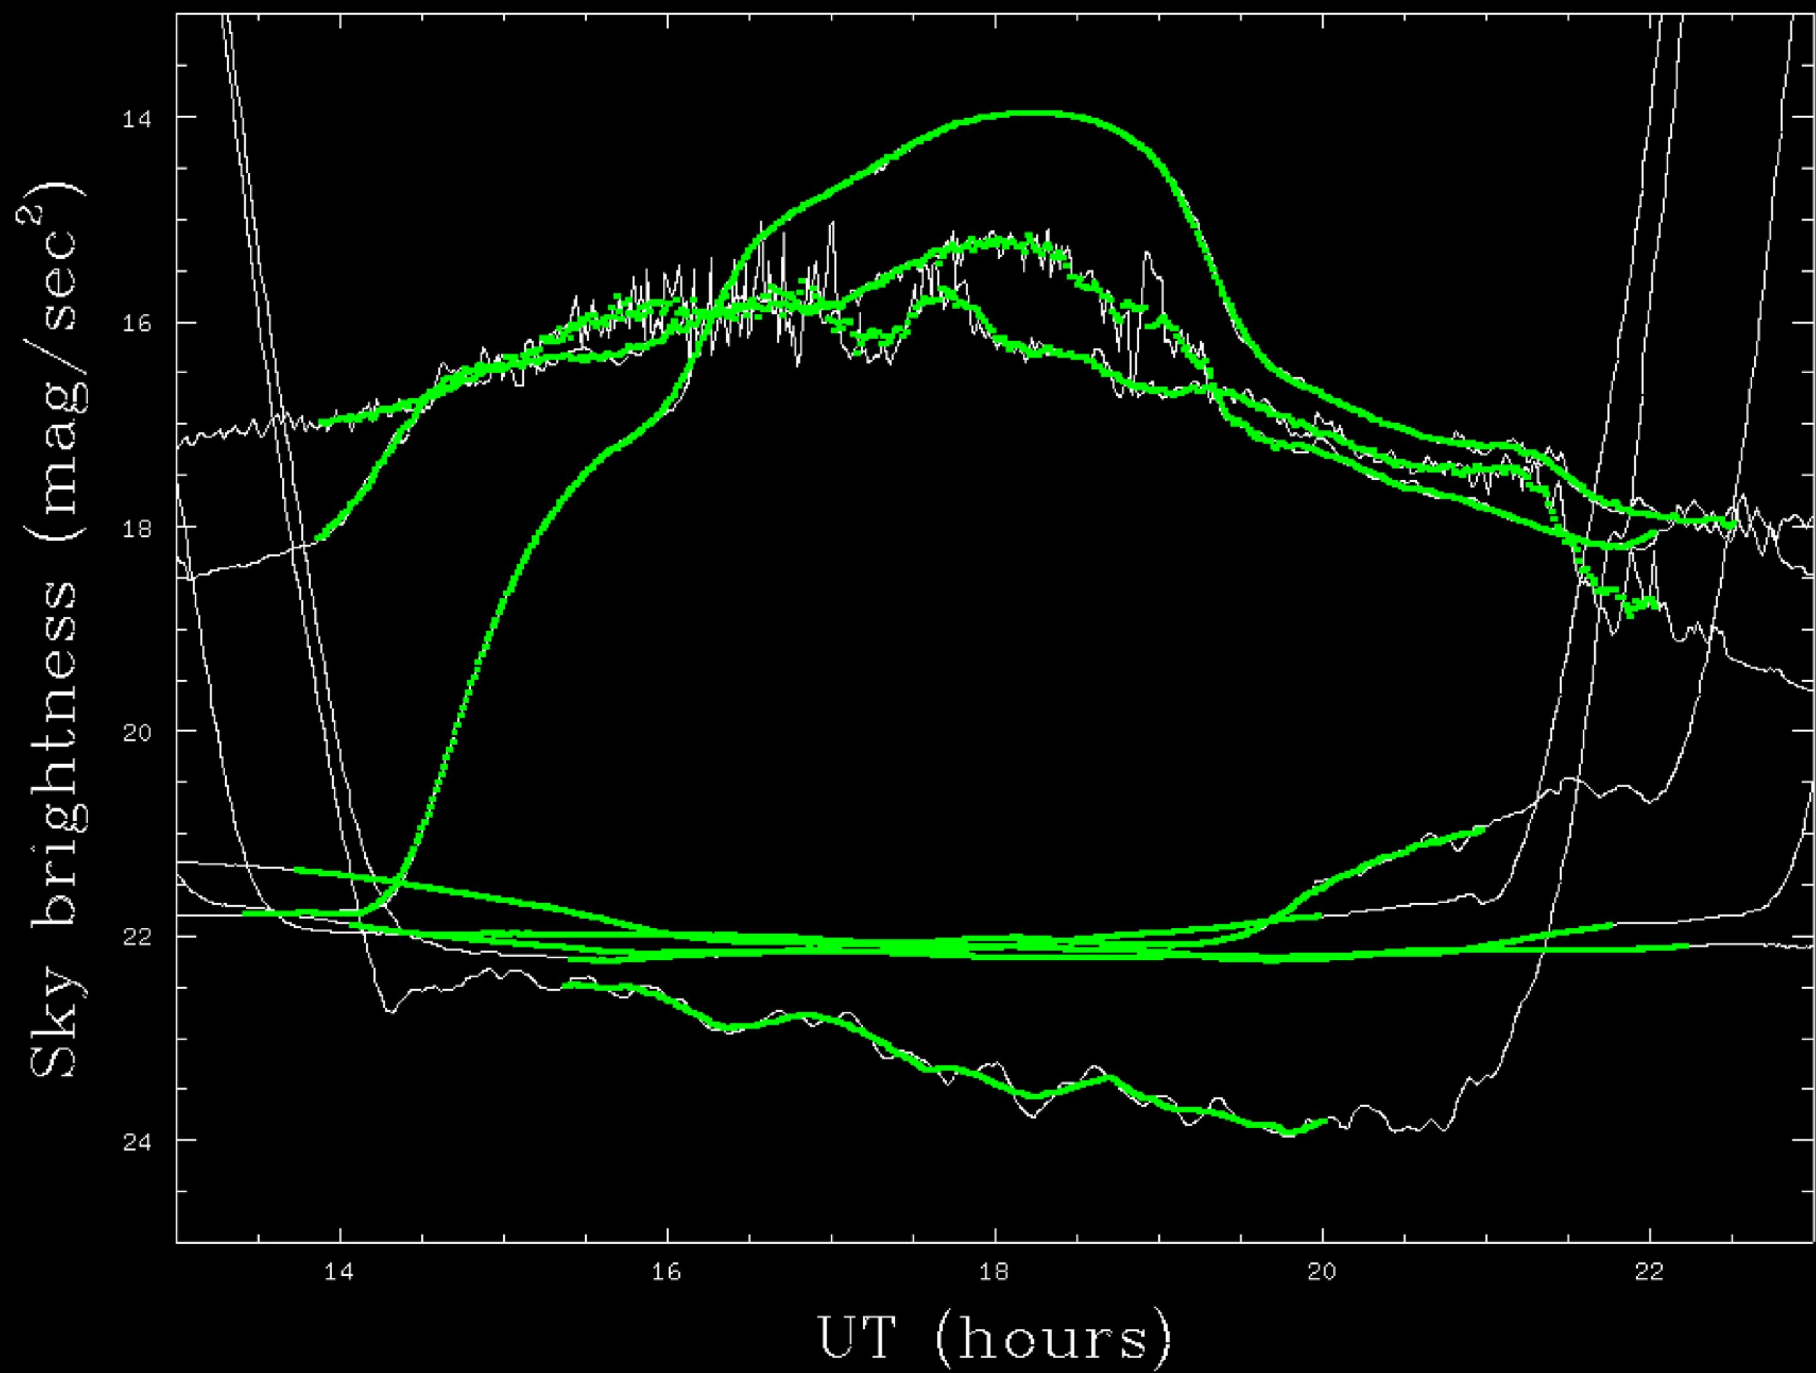

SQM

Sky quality assessment by SQM

- Slope $\frac{\delta M_{SQM}}{\delta t}$ at each data points
- Smoothing (average) with a 15min window (SQM sampling rate 1/min), corresponding to median characteristic timescale of cloud passage
- Reconstruct smoothed data using an smoothed slope in a window of 15min or smaller
- Calculate the residual at each data points (between twilights), giving a quality index

Muztaga

20180115 - 20180330

Dark sky limit: 23.2

“Confidential”

Observing time (Astronomical twilights) stat @ SST

Data until 21/09/2018

Seeing at submit C SST

on 20180922

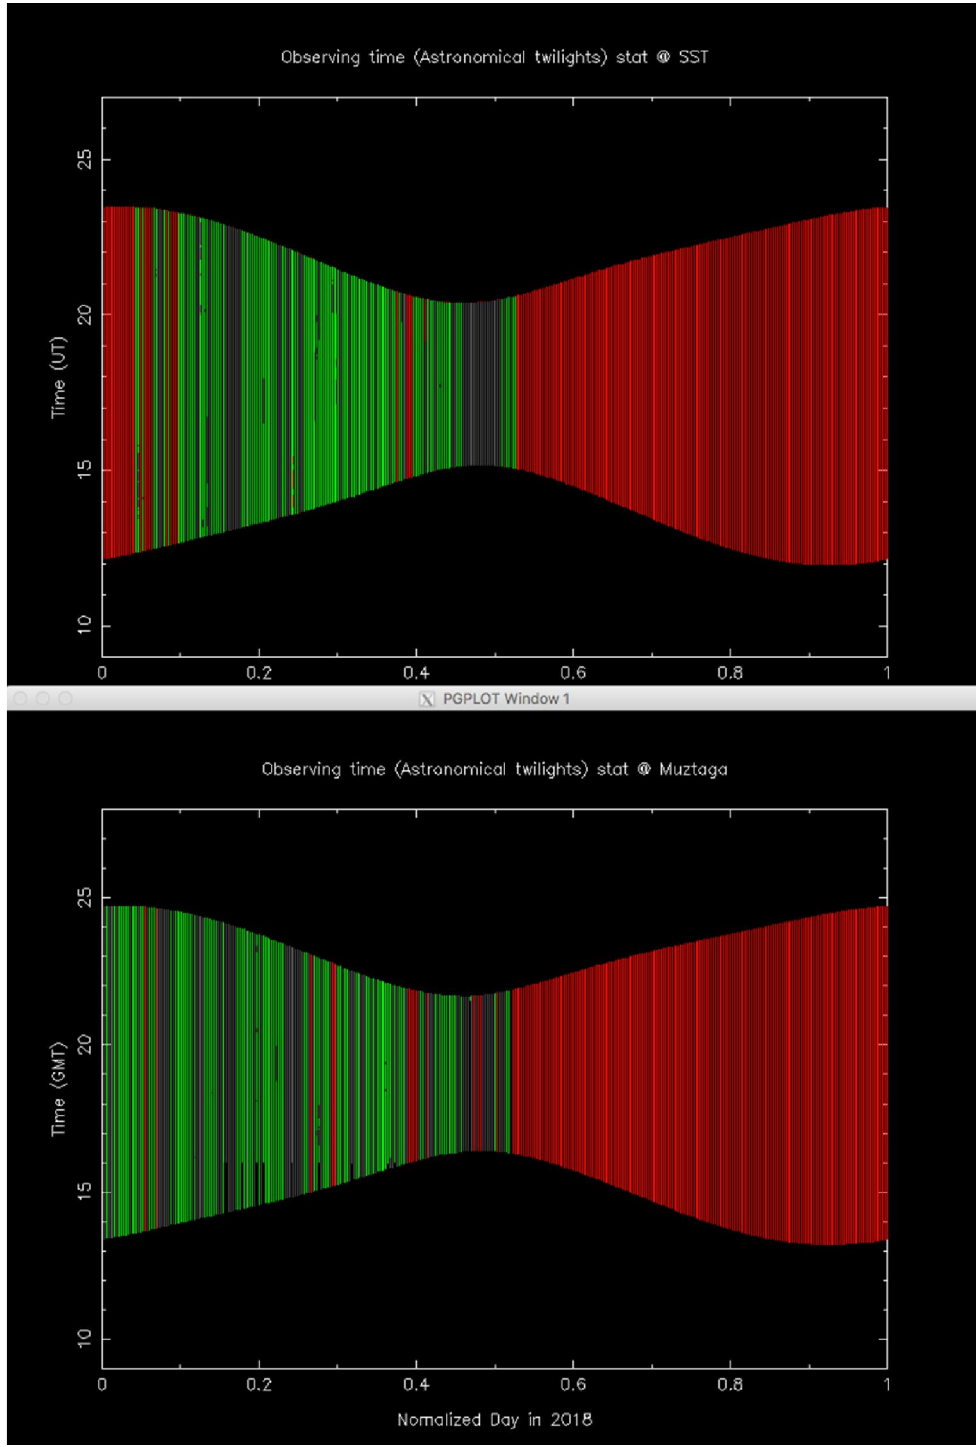

New sites proposed for future plans

Precipitation: DLH vs LH

Lenghu (upper) vs Muztaga (lower)
Sky quality stat.

Saishiteng (SST) site

SONG (China)

- Will be (again) in test mode soon, in Delingha
- Need at least a year for construction
- Need a summer season for relocating and another year for alignment, test
