CMB foregrounds for B-mode studies

150/220
GHz

90 GHz

90 GHz

40 GHz

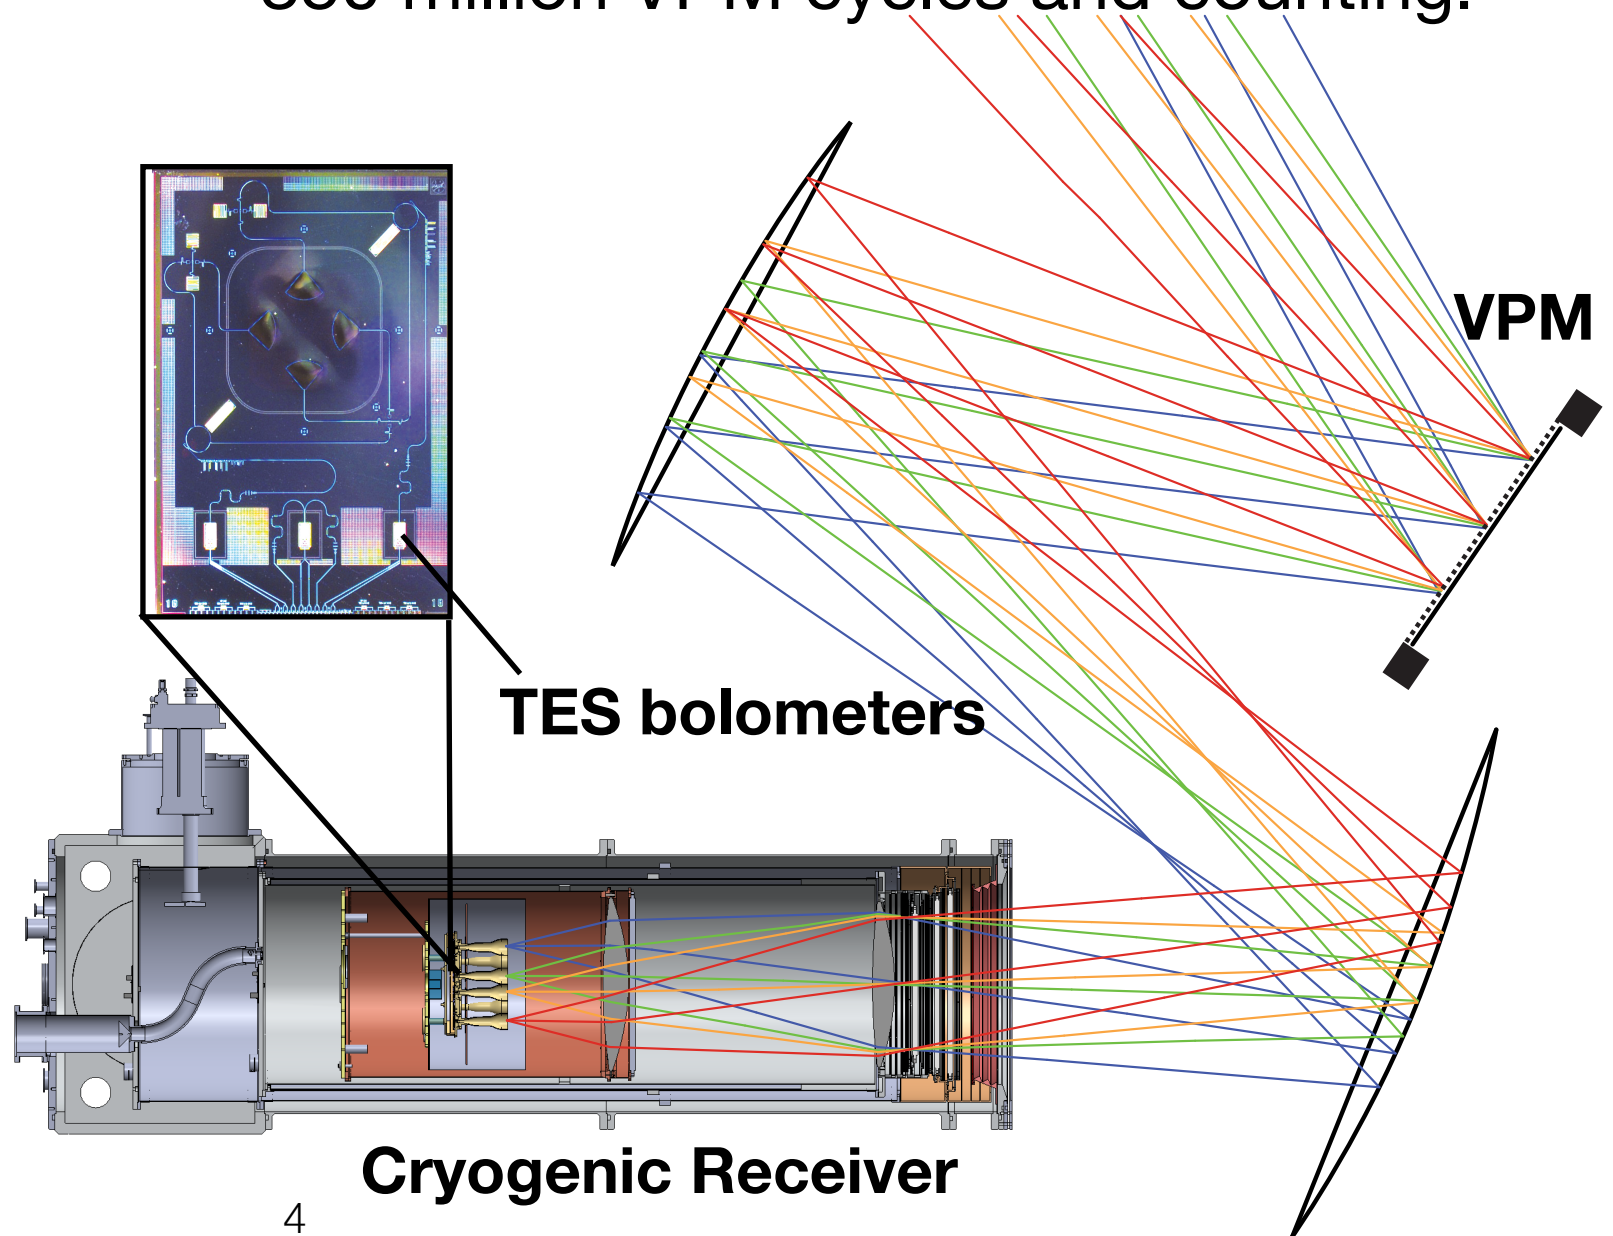

- Survey **75%** of the sky **every day**.
- Telescope is completely shrouded in **co-moving ground screen**.
- **Boresight rotation** enables polarization switching and systematic checks.
- *Fast (10 Hz) front-end polarization modulation enables **targeting the large-scale ($l < 10$) modes of the CMB.***

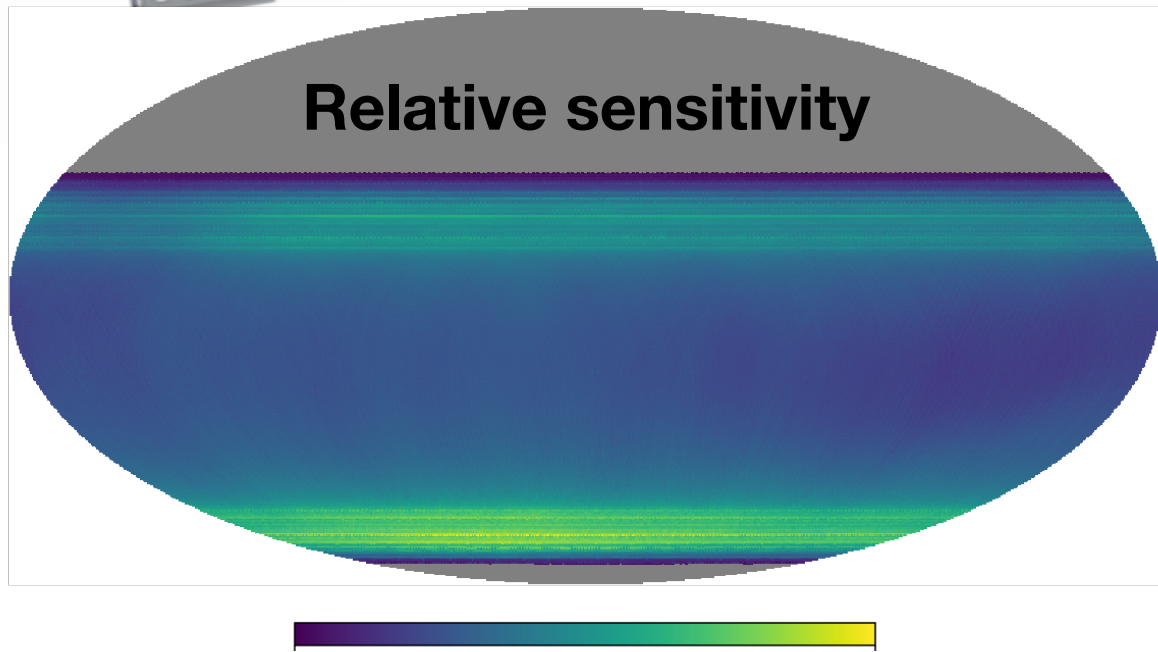

- Initial survey spanned July 2016 to March 2018.
- ~58,000 constant elevation sweeps of the telescope
- ~350 million VPM cycles and counting!

- Total optical efficiency has been measured to be 48%.

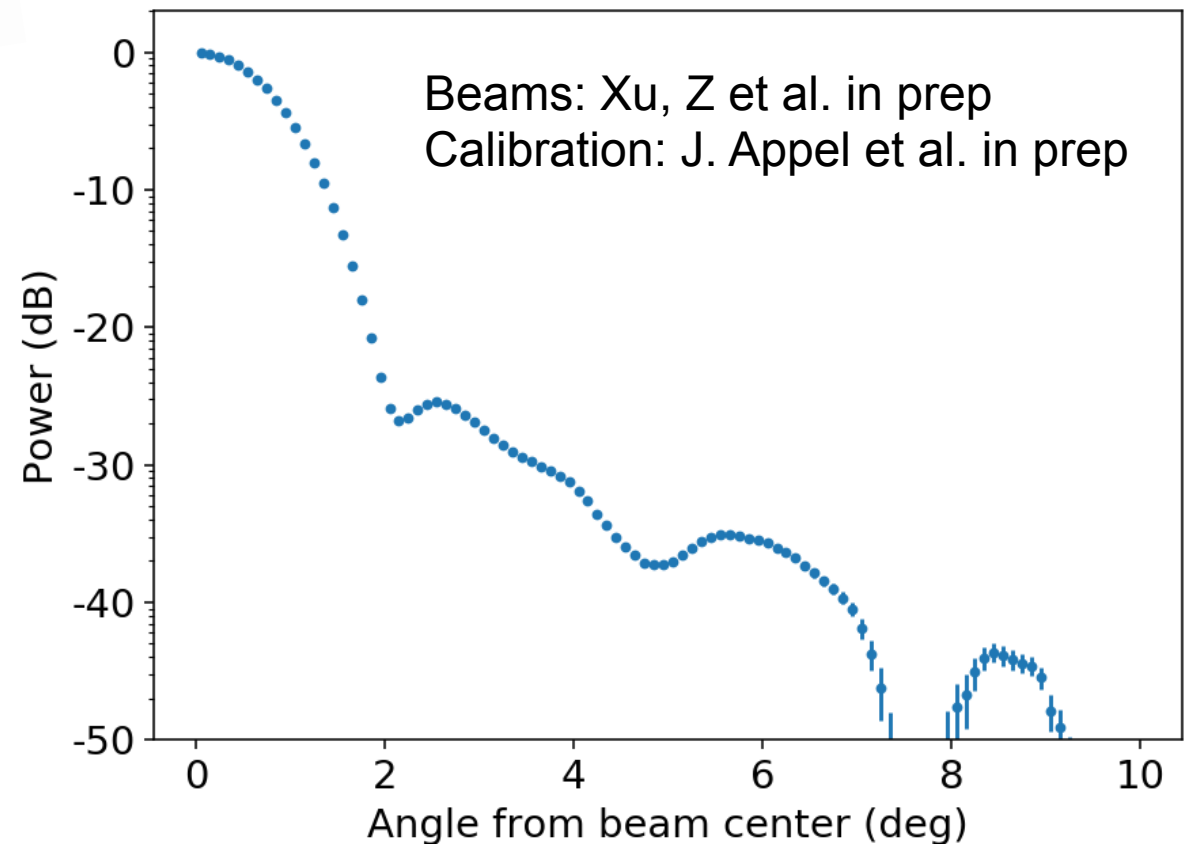

720° azimuthal sweep at 45° elevation

Conclusions

- **Temperature calibration and beam measurements** have been made from mapping the moon.
- Calibration is **consistent with point sources** in the temperature map.
- Front-end polarization modulation has enabled us to make **large-scale maps** of the sky.
- The maps are **consistent with the point sources and extended sources** from previous measurements.

Thank you
