

NORTH & SOUTH: LOW MASS STAR FORMATION IN SERPENS

A Infrared & X-ray View of Serpens North and South Clusters

Elaine Winston

University of Exeter , U.K.

RTN-Constellation (Exeter & Grenoble Nodes):

J. Bouvier, E. Moraux, M. McCaughrean, C. Alves de Oliveira
CHFT/WIRCAM – J, H, Ks, CH4on, CH4off bands
– Serpens North, Serpens South

Harvard-Smithsonian CfA:

S.T. Megeath, S. Wolk, T. Bourke, R. Gutermuth
Spitzer/IRAC – 3.6, 4.5, 5.8, 8.0 μ m
Chandra/ACIS-I
– Serpens North, Serpens South

OUTLINE

- Spitzer & Chandra previous studies
- WIRCam Near-IR: new YSOs and YBDs
- Comparison with Spitzer & Chandra
- North & South: clustered stellar evolution
- Conclusions

W40, 600pc

Serpens South

SERPENS NORTH

- Nearby (260–410pc), Low Mass
- Embedded, $A_v \approx 20$
- Numerous Protostars & Outflows
- **137** known members
- 21 Class 0/I (9 X-ray)
- 17 Flat Spectrum (9 X-ray)
- 63 Class II (20 X-ray)
- 4 Transition Disks (2 X-ray)
- 21 Class III

SERPENS SOUTH

- Nearby? Low Mass
- Deeply Embedded, $A_v \approx 50$
- Extremely High Protostar fraction & many Outflows
- **92** known members (Gutermuth 2008)
- 46 Class 0/I (10 X-ray)
- Possibly 1–15 of which FS
- 46 Class II (14 X-ray)
- Possibly 1–2 Transition Disks
- **4 Class III**

SERPENS NORTH

SERPENS SOUTH

3.6: Blue, 4.5: Green, 5.8: Red

SERPENS NORTH

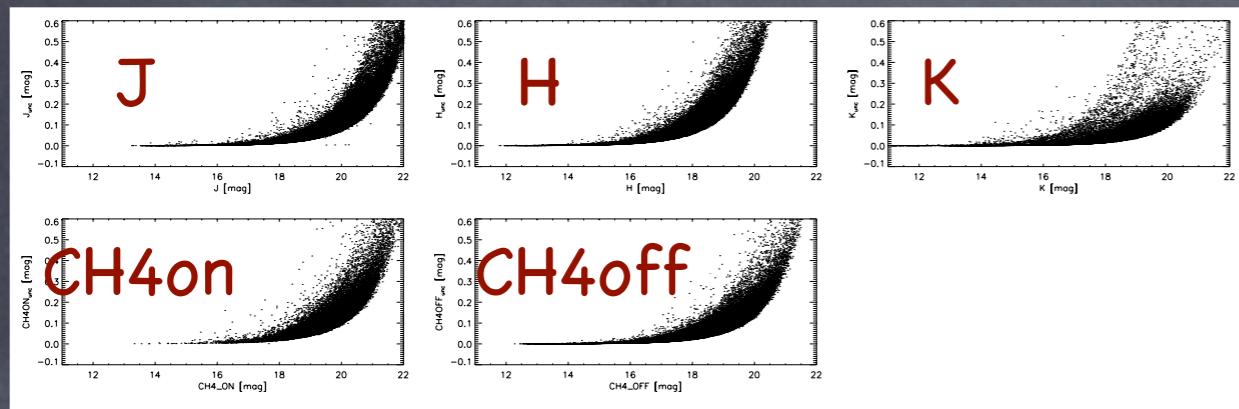

SERPENS SOUTH

J: Blue, H: Green, K: Red

WIRCam Aperture Photometry

Source Detections using PhotVis: IDL based on DAOPhot routines

Detections per field: ~60,000–90,000 in J, H, K

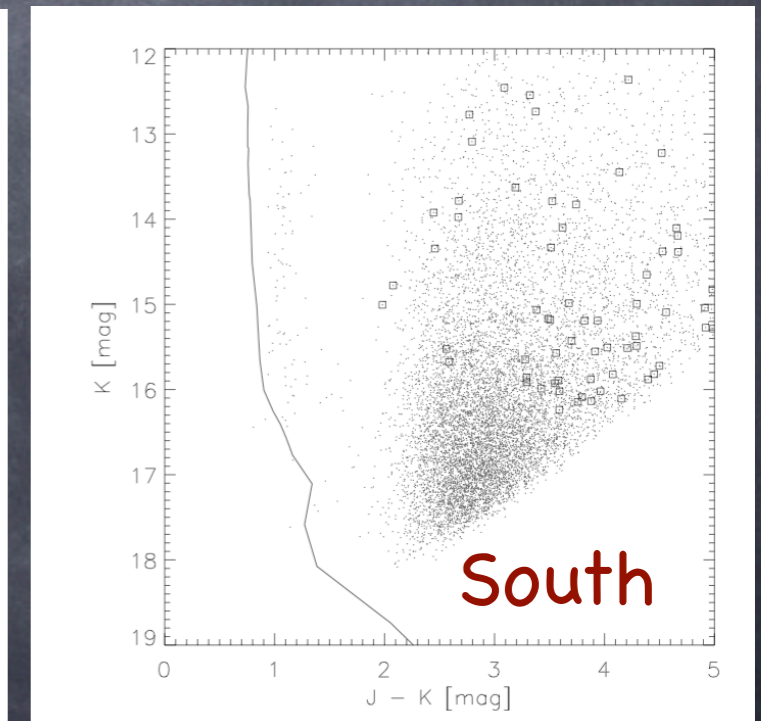

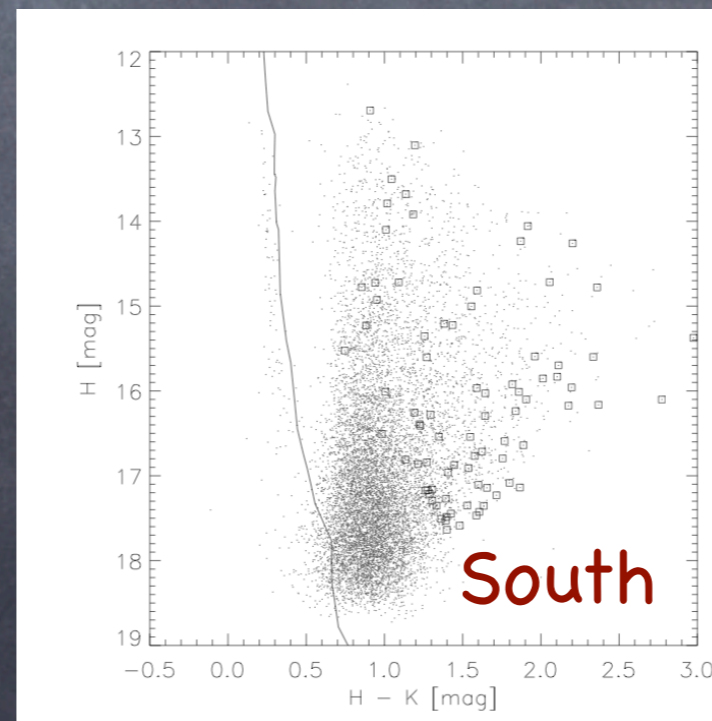

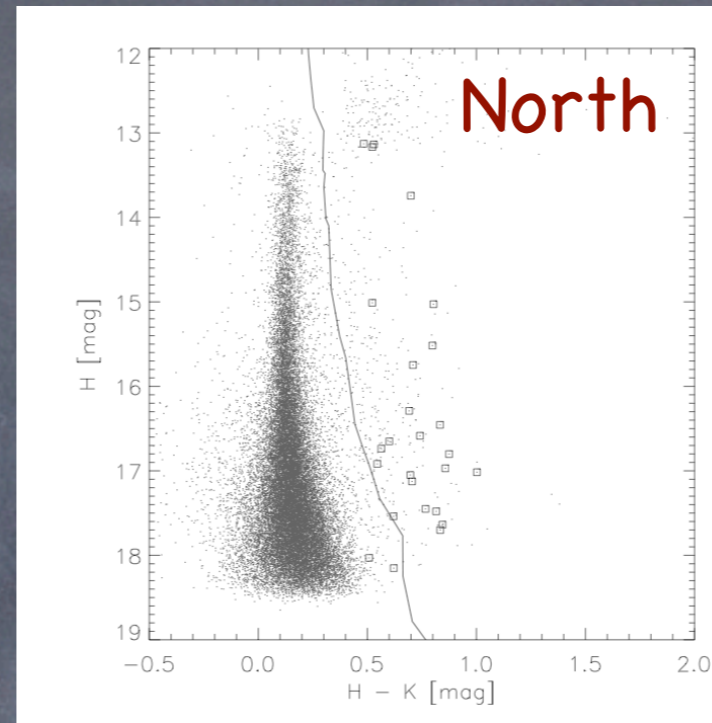

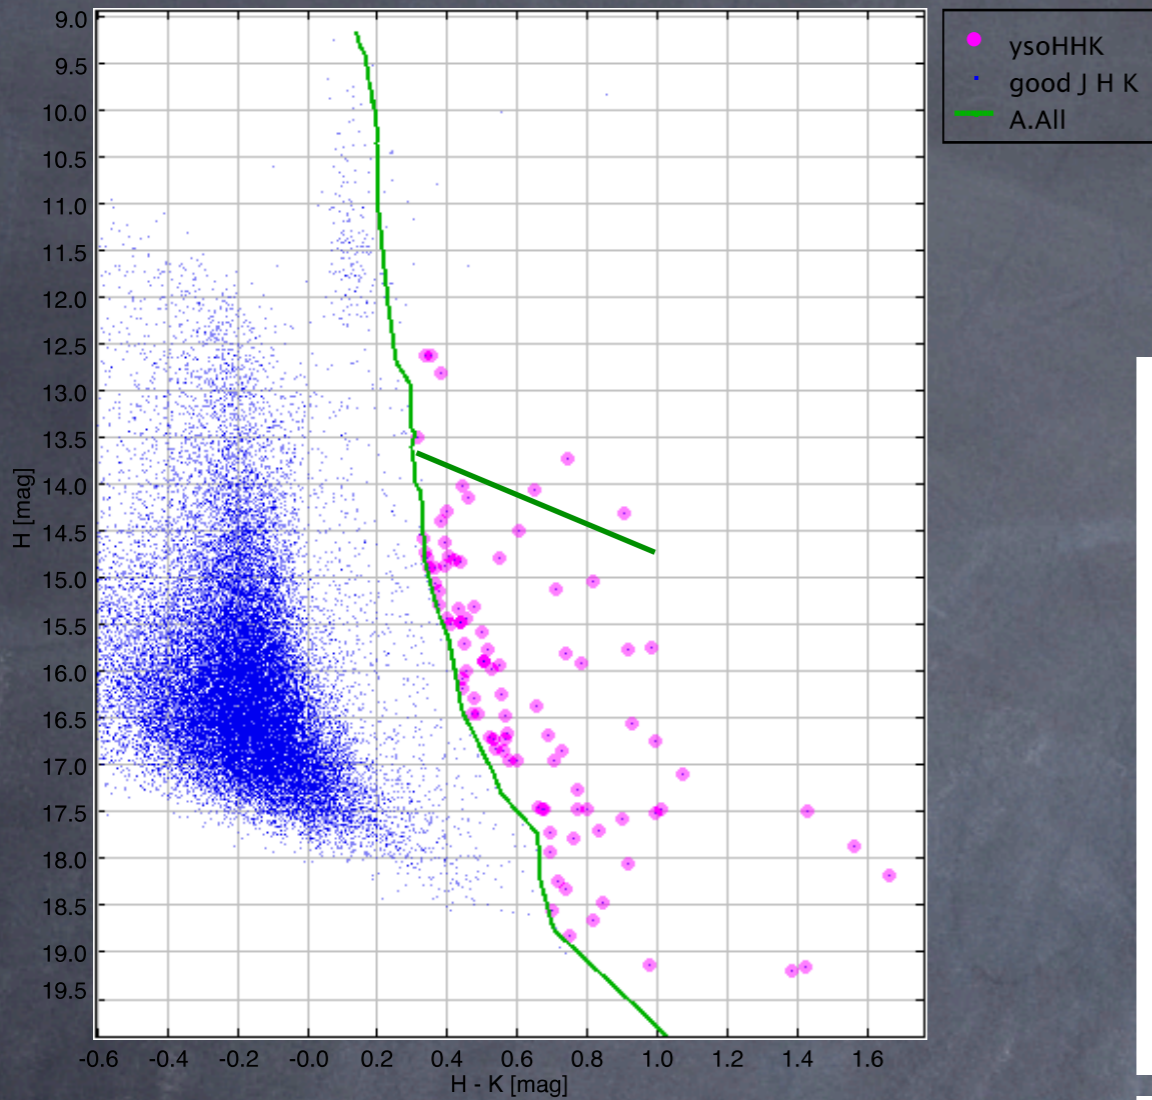

~20,000 in CH4on, CH4off

Detection threshold: J: 22, H: 21, K: 21 (~5mag fainter than 2MASS)

Completeness Limit: J: 20, H: 18, K: 17.5

Comparison with 2MASS: ~0.05–0.07 offsets (expected with filters)

SELECTION OF YSOs/YBDs

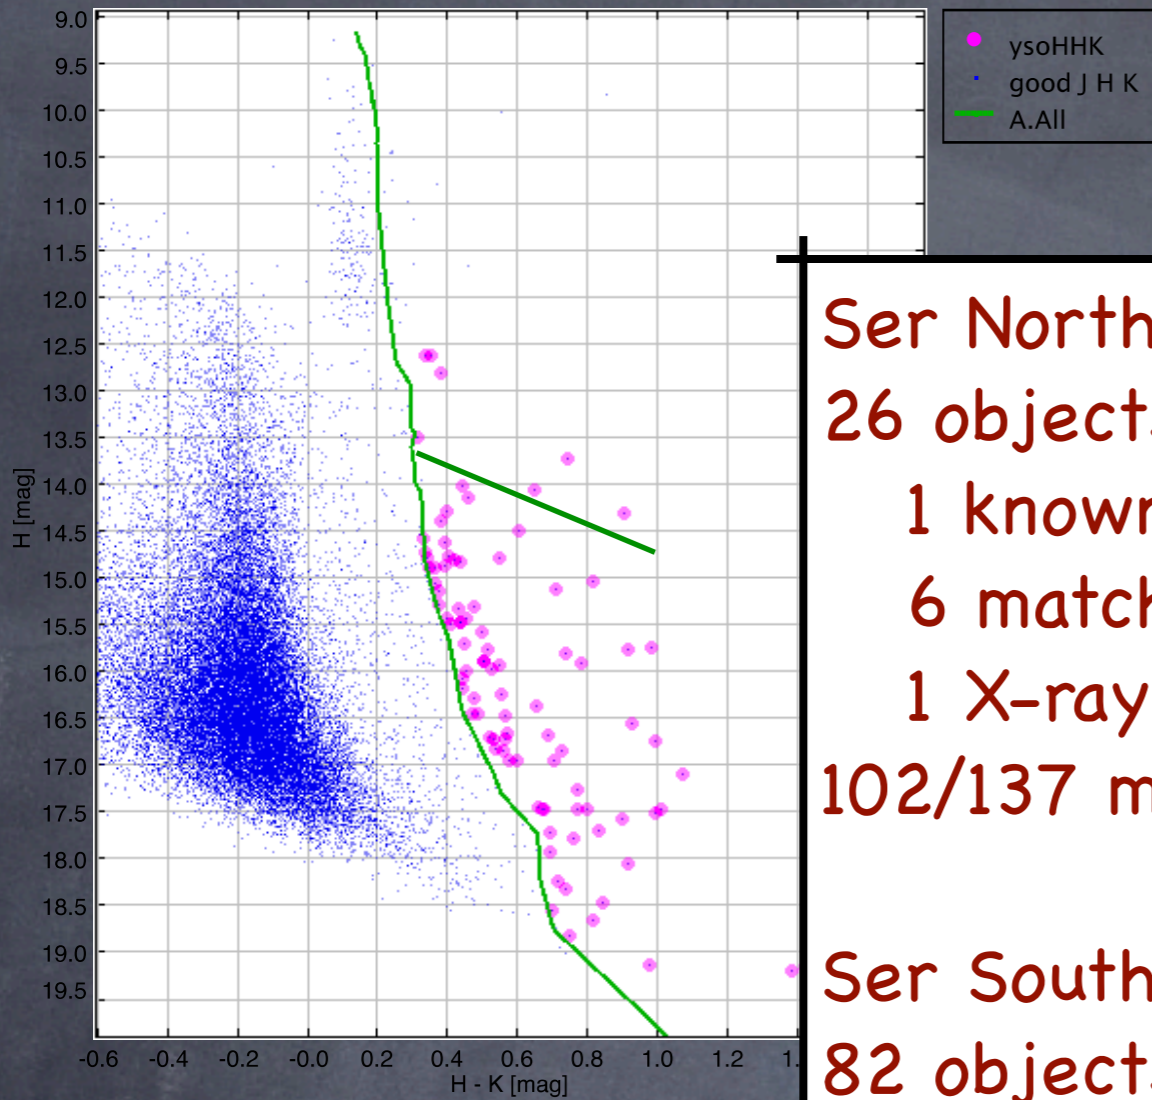

Colour Magnitude Diagrams:

K v $J-K$ & H v $H-K$

Photometry is dereddened before selection is made.

Plots on right show underreddened photometry

SELECTION OF YSOs/YBDs

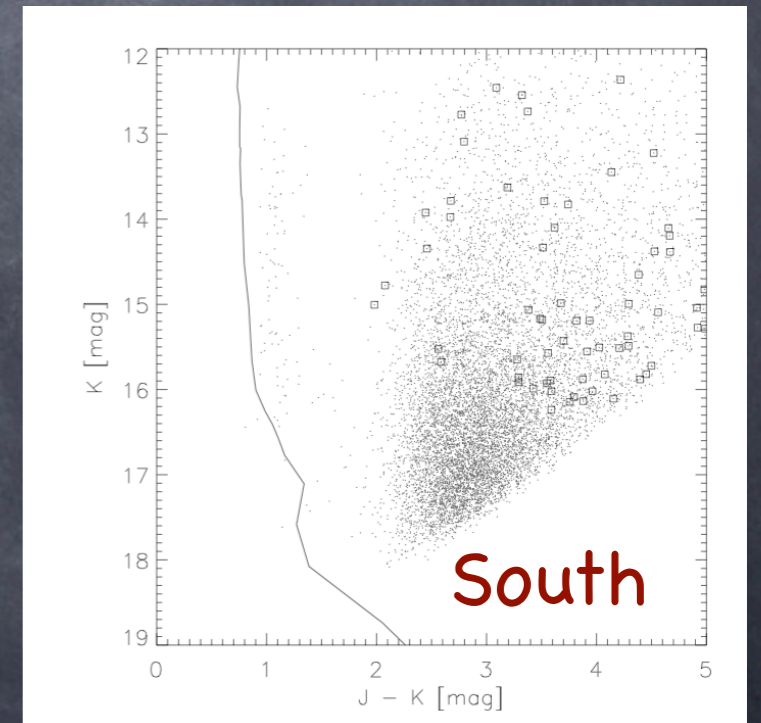

Ser North:
 26 objects < 1 Myrs:
 1 known YSO
 6 match in IR catalogue
 1 X-ray detection
 102/137 matches to YSOs

Ser South:
 82 objects < 1 Myrs:
 11 known YSO
 59 match in IR catalogue
 2 X-ray detection
 76/92 matches to YSOs

Colour Magnitude Diagram
 $K \nu J-K$ & $H \nu H-K$

Photometry is dereddened before selection is made.

Plots on right show underreddened photometry

NORTH & SOUTH

Spatial Distribution:

Young Stars

Young Brown Dwarfs

X-ray Luminosity Functions:

Distance to the clusters

Disk & X-ray Properties of the clusters

SPATIAL DISTRIBUTION FOR NORTH & SOUTH

North

South

Fragmentation processes, Formation of protostellar cores, Dynamical evolution of the stars from protostellar to pre-main sequence.

Recent studies have shown that in many clusters the sources trace the underlying molecular gas distribution.

SPATIAL DISTRIBUTION OF YSOs/YBDs

6 candidates
match to midIR:
3 CII, 3 CIII

59 candidates
match to Spitzer:
38 CII, 21 CIII

26 candidate
new YSOs/YBDs
< 1 Myrs

82 candidate
new YSOs/YBDs
< 1 Myrs

X-RAY LUMINOSITY FUNCTION: DISTANCE TO SERPENS

Feigelson & Getman 2005 have found a universal log-normal distribution for the XLFs of Orion IC 348 & NGC 1333:

$$\langle \log(L_x) \rangle = 29.3, \sigma_{\log(L_x)} = 1$$

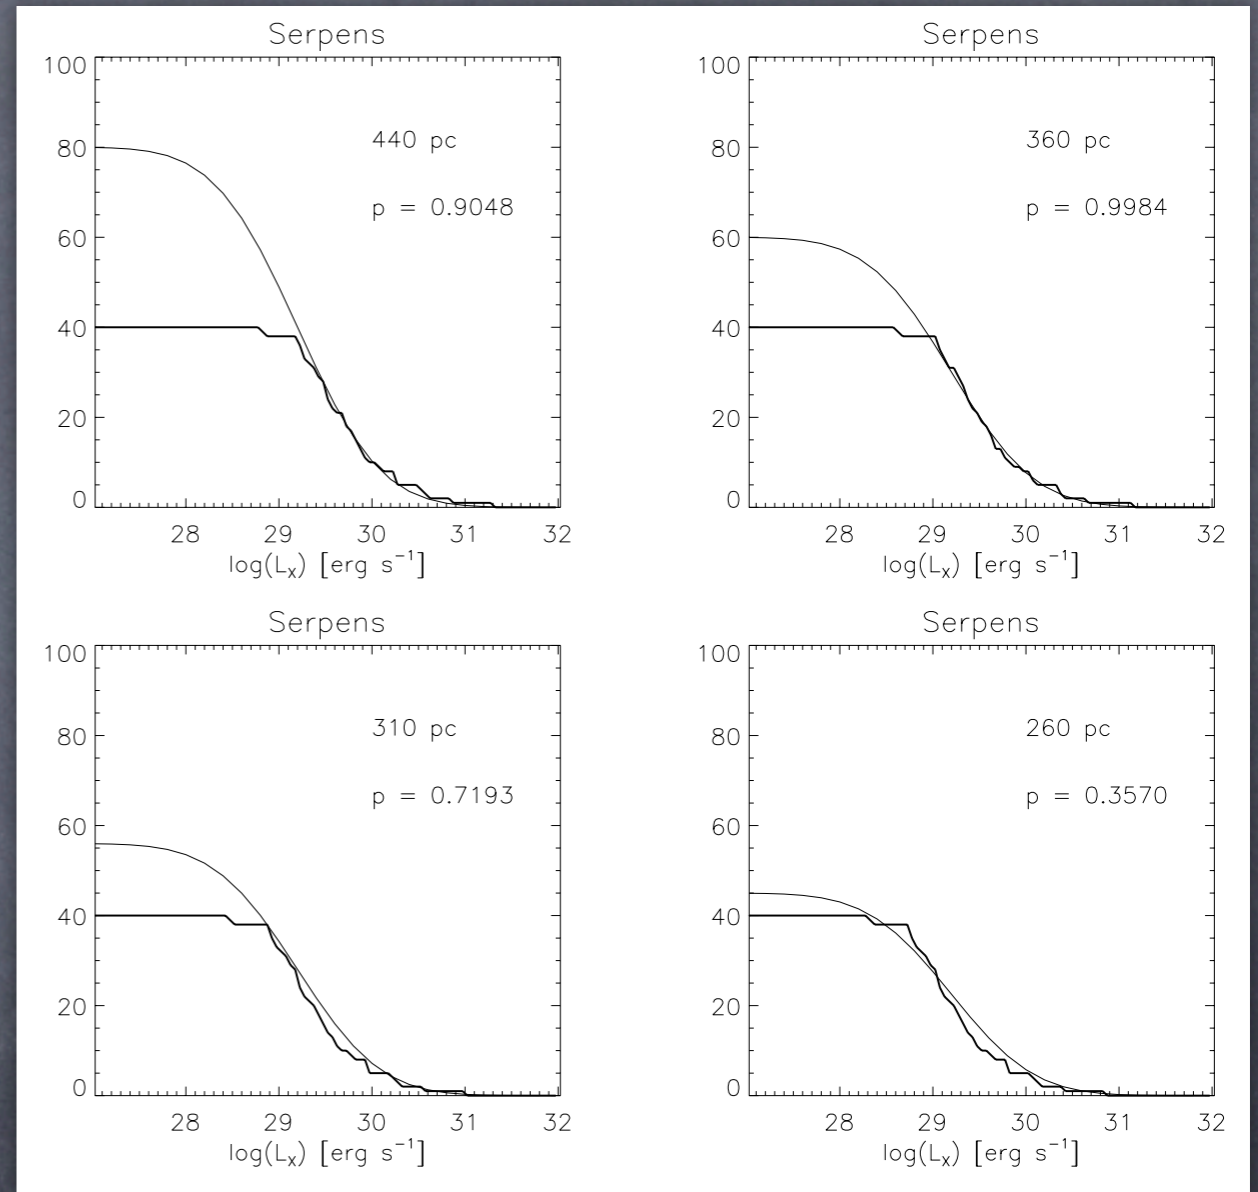

Can fit XLF by varying distance and number of sources in the cluster

Current Accepted Distance to Serpens: 260 pc

NGC 1333 at 240pc

Serpens at 410, 360, 310, 260pc

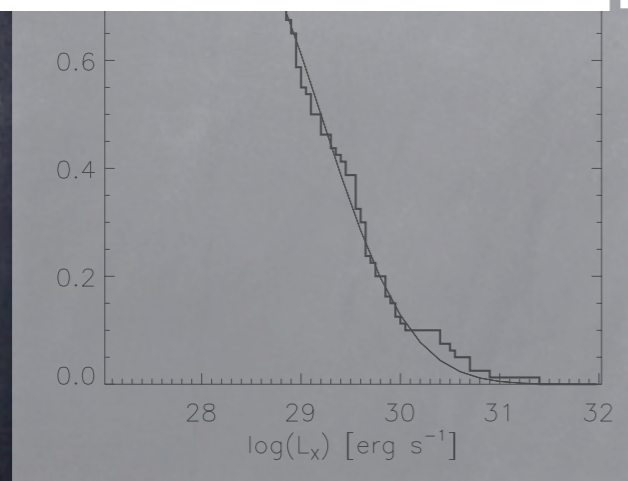

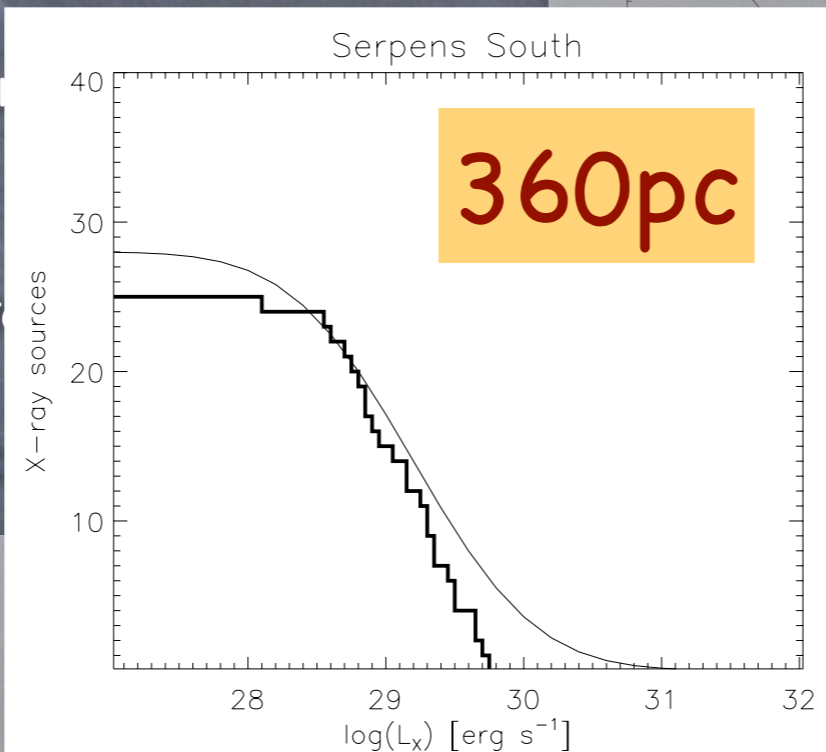

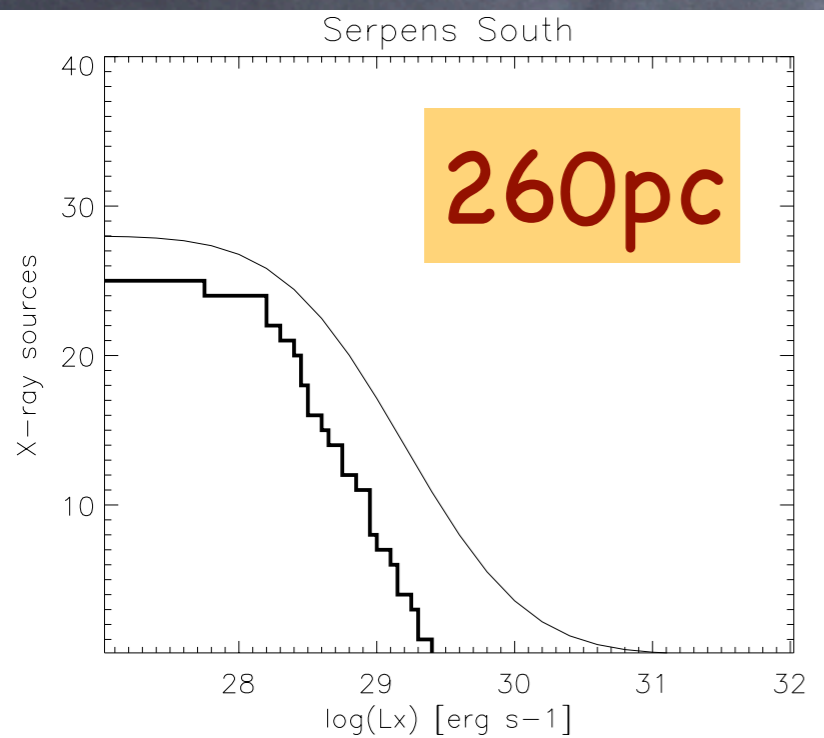

Best Fit to Serpens at 360pc

X-RAY LUMINOSITY FUNCTION: DISTANCE TO SERPENS

Feigelson & Getman 2005 have found a universal log-normal distribution for the XLFs of Orion IC 348 & NGC 1333:
 $\langle \log(L_x) \rangle = 29.3$, $\sigma_{\log(L_x)} = 1$

Serpens at 410, 360, 310, 260pc

Serpens South?

Best Fit to Serpens at 360pc

HERTZPRUNG-RUSSEL DIAGRAM FOR SERPENS NORTH

360pc

Class 0/I: circles
Flat Spectrum: inverted triangles
Class II: triangles
Transition Disks: diamonds
Class III: squares.

MMT/HectoSpec: far red 4000-9000Å
IRTF/SpeX: near-IR, J,H,K bands

Filled Symbols are X-ray detected YSOs

Assumed Cluster Distance: 260, 360 pc

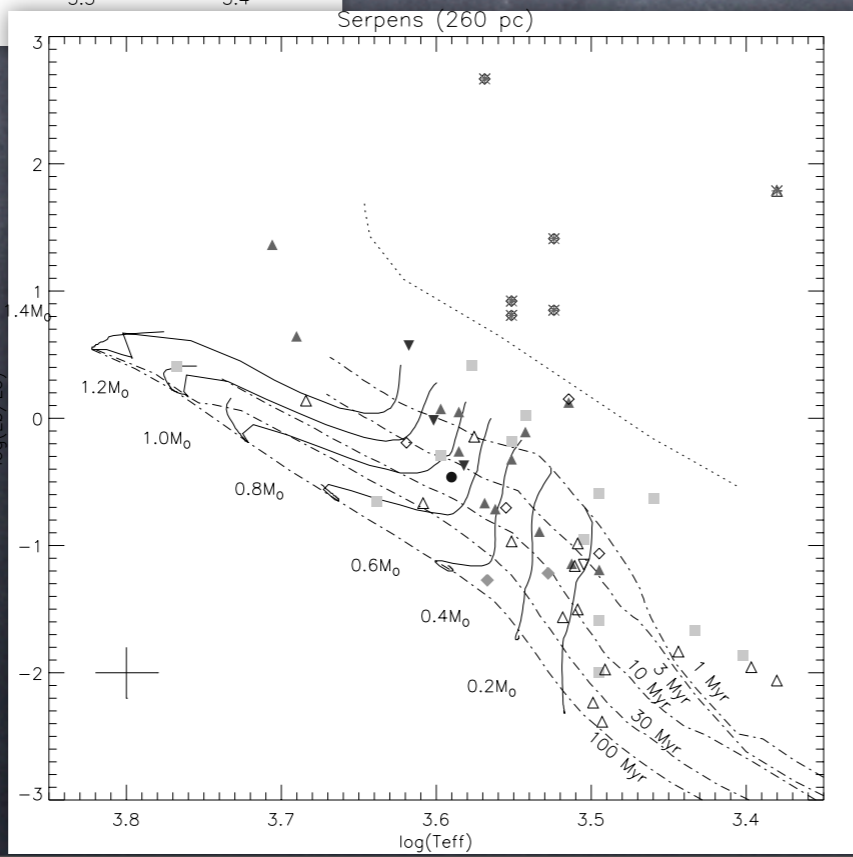

Average cluster age: 3-5, 1 Myrs

Class II & Class III have statistically similar ages

Isochrones from Baraffe et al 1998

Birthline: objects above are likely AGB

260pc

X-RAY DETECTION BY CLASS

In Serpens North: 50% of sources in each evolutionary class detected in X-rays.

In Serpens South: 30% of sources detected in X-rays

More Deeply Embedded Region

Envelope/Disk obscuration/absorption

Younger objects not yet emitting as strongly??

How does this affect the estimate of the Class III fraction?

X-RAY DETECTION BY CLASS

In Serpens North: 50% of sources in each evolutionary class detected in X-rays.

In Serpens South: 30% of sources detected in X-rays

More Deeply Embedded Region

Envelope/Disk obscuration/absorption

Younger objects not yet emitting as strongly??

How does this affect the estimate of the Class III fraction?

DISK FRACTION

Serpens North: 49% \pm 11%

Serpens South: 78% \pm 21%

Appreciably higher in South, indicating young evolutionary stage of cluster

BD candidates: North: $3/(3+3) = 50\% \pm 28\%$, South: $38/(38+21) = 64\% \pm 10\%$

Assume a similar detection fraction of CII and CIII (may not hold here)

Implies total of 13 CIIIs in cluster for this completeness limit ($\sim 0.2 M_{\text{sun}}$)

X-RAY DETECTION BY

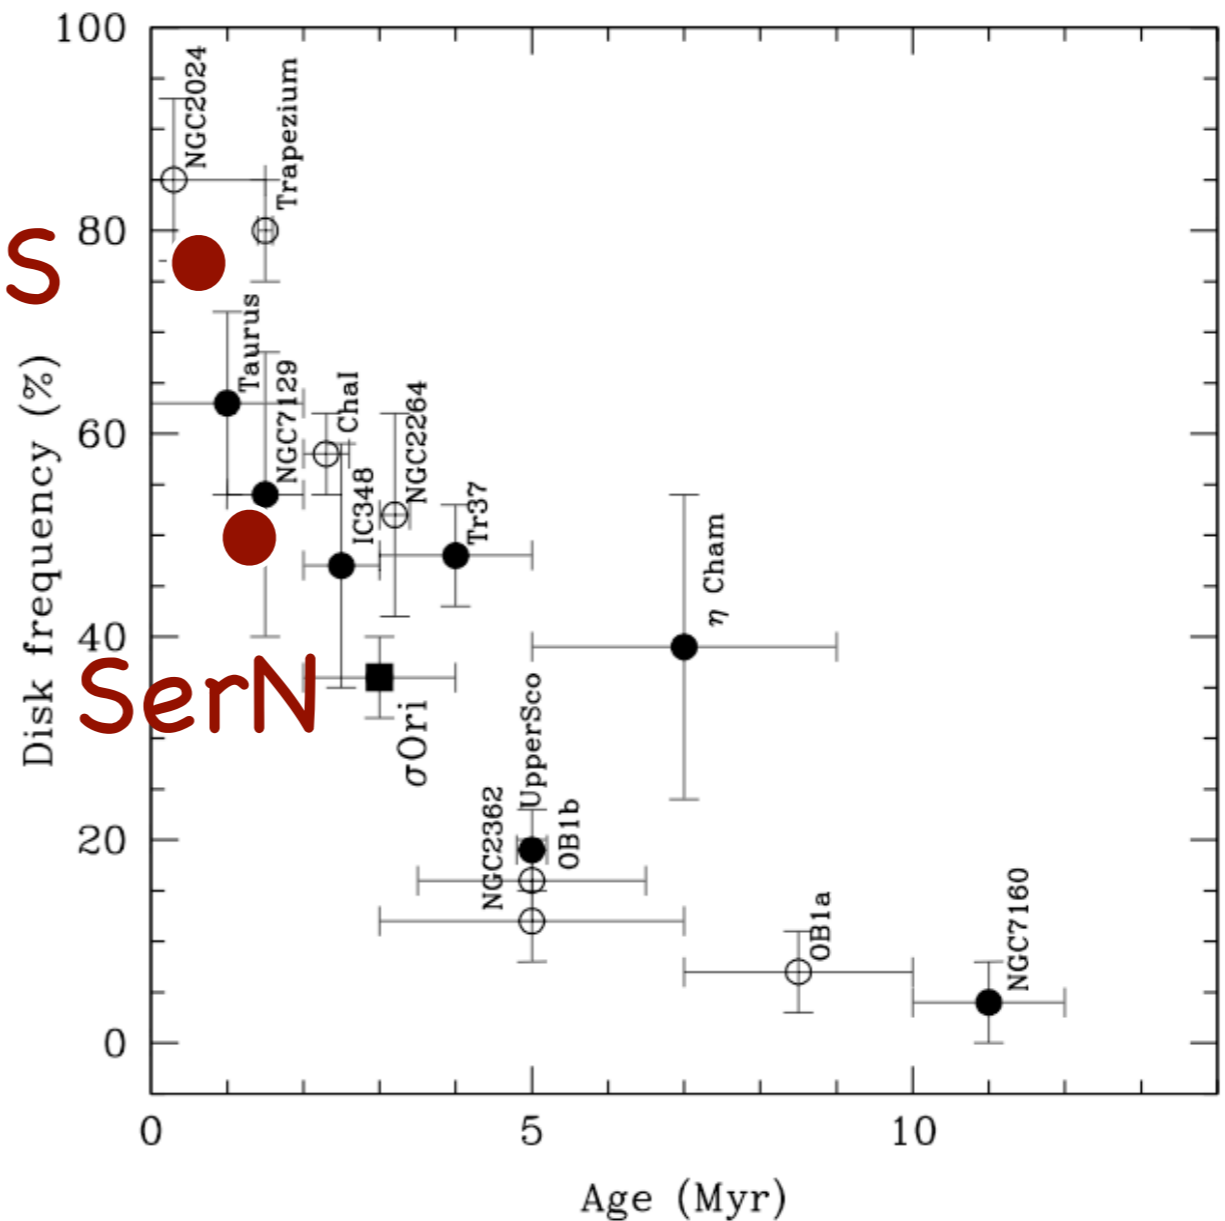

In Serpens North: 50% of sources

In Serpens South: 30% of sources detected

More Deeply Embedded Region
Envelope/Disk obscuration/absorption
Younger objects not yet emitting as strongly
How does this affect the estimate of disk frequency?

SerS

SerN

DISK FRACTION

Serpens North: 49% ± 11%

Serpens South: 78% ± 21%

Appreciably higher in South, indicating young evolutionary stage of cluster

BD candidates: North: $3/(3+3) = 50\% \pm 28\%$, South: $38/(38+21) = 64\% \pm 10\%$

Assume a similar detection fraction of CII and CIII (may not hold here)

Implies total of 13 CIIIs in cluster for this completeness limit (~0.2 Msun)

X-RAY TO IR PROPERTIES

$N_H \propto A_K$:

Hydrogen Column Density (N_H) vs. Extinction at K-Band (A_K)

Standard ISM: $N_H \sim 1.6 \times 10^{21} A_V$ (Young et al 2003)

Serpens exhibits a lower than Expected Ratio: $\sim 0.6 \times 10^{22(21)} A_{K(V)}$

Class O/I: circles
 Flat Spectrum: inverted triangles
 Class II: triangles
 Transition Disks: diamonds
 Class III: squares.

Grain Growth

Change in Dust
 to Gas Ratio

Icy Mantles

CONCLUSIONS

- Spitzer & Chandra identify **137** & **92 YSOs** in Serpens North and South, respectively.
- WIRCam: **26** (6: 3 CII, 3 CIII) new candidates in Serpens North and **82** (59: 38 CII, 21 CIII) new candidates in Serpens South.
- Spatial Distributions **similar**; South more condensed.
- Distance to both clusters is likely to be **360pc** or higher..
- Disk Fraction in **South > North** : younger age.
- Evidence of **Grain growth** occurring in both clusters.

CONCLUSIONS
