

# The chase for exoplanet false positives and contamination corrections

Pascal Bordé

Institut d'astrophysique spatiale  
Université Paris-Sud

11<sup>th</sup> CoRoT Week – La Laguna, Tenerife  
19 March 2013

- 1 Aperture photometry in the exoplanet channel
- 2 Modeling of exoplanet imagerettes
- 3 Chasing exoplanet false positives
- 4 Conclusions

- 1 Aperture photometry in the exoplanet channel
- 2 Modeling of exoplanet imagerettes
- 3 Chasing exoplanet false positives
- 4 Conclusions

# From photometric masks to (3-color) light curves

Corot-1 as seen by Corot

Corot-1 white and color LCs

Because the PSF is large (10 pix  $\leftrightarrow$  23"), neighboring PSFs overlap.  
 $\Rightarrow$  The fluxes of neighbor stars leak into the target mask.

# Consequences for exoplanet search

Flux contamination by neighboring stars:

- modifies transit relative depths, hence inferred companion radii;
- creates exoplanetary-like transits = *false positives*.

⇒ Know your target environments + correct for flux contaminations.

- 1 Aperture photometry in the exoplanet channel
- 2 Modeling of exoplanet imagettes**
- 3 Chasing exoplanet false positives
- 4 Conclusions

## Using higher resolution images

Corot imagette

Palomar + Exodat

# The need for a good stellar catalog

PPMXL catalog

Exodat catalog

## Corot PSFs

## Contamination computation (1)

Original

Computed

## Contamination computation (2)

Original

Target removed

## Contamination results

white = 3.1%, blue = 0.6%, green = 1.1%, red = 5.0%

# What about accuracy/uncertainty?

Complex problem  $\Rightarrow$  should be Monte-Carlo computed  
(to be completed soon).

- 1 Aperture photometry in the exoplanet channel
- 2 Modeling of exoplanet imagerettes
- 3 Chasing exoplanet false positives**
- 4 Conclusions

## White contamination per neighboring star

#	arcsec	Corot ID	RA, DE	X, Y	r'
0	0.00	102890318	102.079870, -3.102160	1986, 1194	13.43
1	8.24	102890027	102.078160, -3.103680	1988, 1191	17.96
2	11.52	102890327	102.079910, -3.105360	1991, 1193	16.87
3	19.65	102889909	102.077530, -3.107090	1993, 1189	16.75
4	23.41	102890547	102.081070, -3.095770	1977, 1197	19.63

#	arcsec	r'	flux	%	dF/F
0	0.00	13.43	7405	96.91	2.23
1	8.24	17.96	81	1.06	> 100
2	11.52	16.87	148	1.95	> 100
3	19.65	16.75	6	0.08	> 100
4	23.41	19.63	0	0.00	> 100

## Unveiling a contaminating eclipsing binary (1)

Folded white transit

Folded color transits

# Unveiling a contaminating eclipsing binary (2)

Computed imagette

Palomar + Exodat

## Unveiling a contaminating eclipsing binary (3)

#	red (%)	dr/r	green (%)	dg/g	blue (%)	db/b
0	94.81	0.23	98.79	0.05	96.96	0.01
1	0.30	73.97	0.05	> 100	0.04	25.82
2	0.68	32.08	0.50	9.66	0.45	2.22
3	4.11	5.33	0.61	8.02	0.33	3.06
4	0.00	> 100	0.01	> 100	0.08	12.16
5	0.00	> 100	0.00	> 100	0.00	> 100
6	0.00	> 100	0.00	> 100	2.05	0.49

For a CEB, we expect:  $dr/r \simeq dg/g \simeq db/b$ .  
 $\Rightarrow$  the culprit is contaminant #3!

- 1 Aperture photometry in the exoplanet channel
- 2 Modeling of exoplanet imagettes
- 3 Chasing exoplanet false positives
- 4 Conclusions**

# Take-home messages

## Contamination by neighboring stars:

- can be computed using Corot & Exodat data;
- should be accounted for before estimating exoplanet parameters.

## Contamination calculations:

- make it possible to identify some exoplanet false positives;
- can be used to inform follow-up and save time.
