

Goal

- **Create a CoRoT ExoField archive suitable for solar-like oscillators**
- Remove most of the long-period non-stellar effects
- *Do not* suppress stellar signal
- Have an automatic method

PLAN

- I. The method originally developed for Kepler
- II. First test with CoRoT data

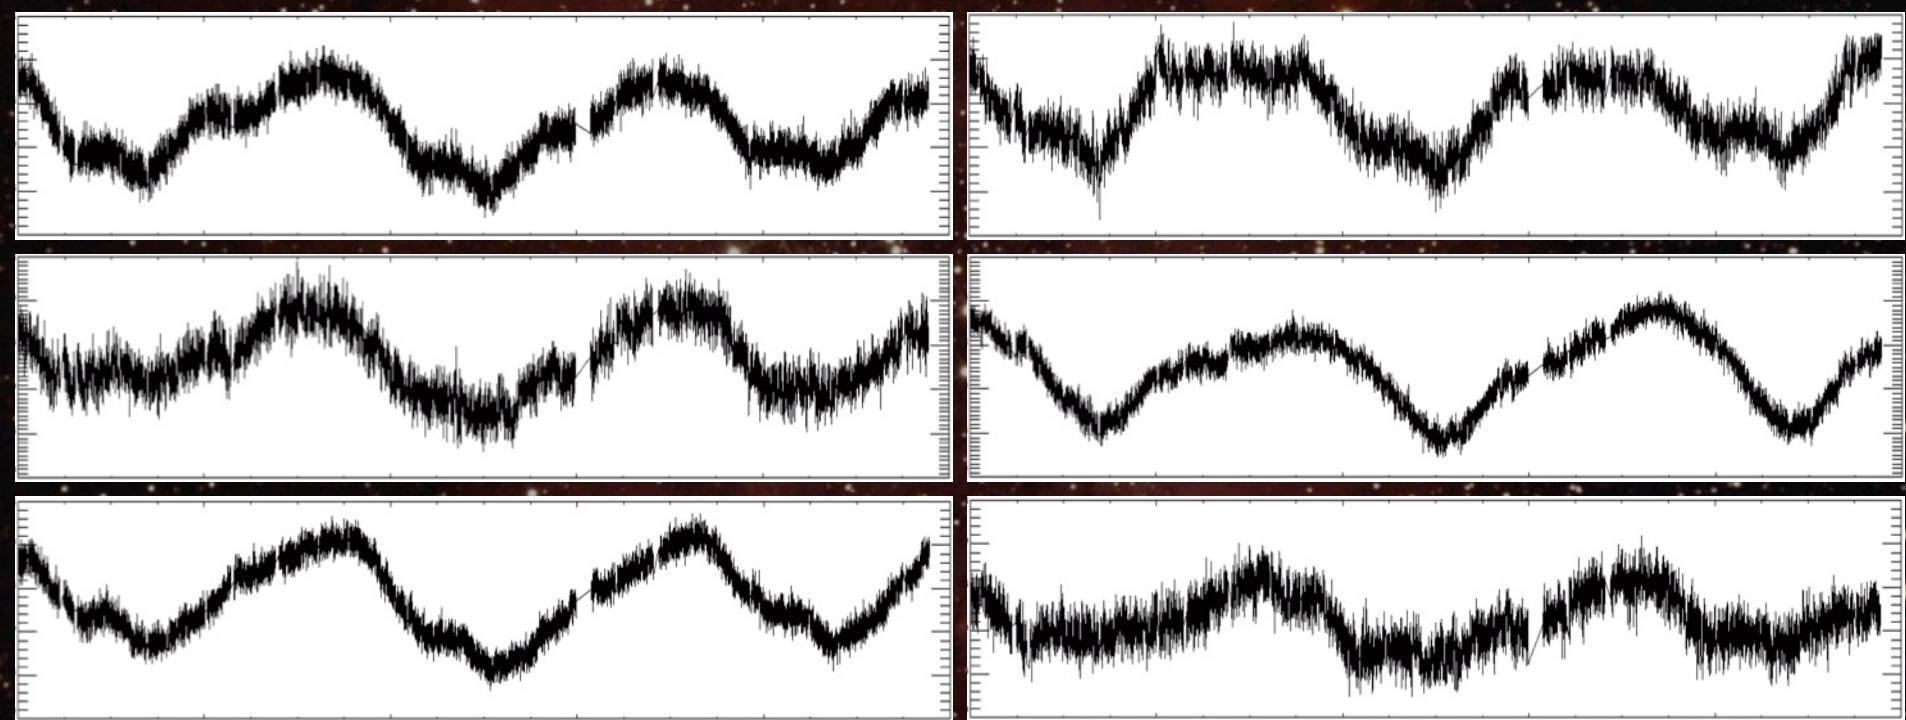

I.

The method developed for Kepler

- ◆ Instrumental modulation in *Kepler* data
- ◆ The method and its consequences

I. The method developed for Kepler

□ Global tendency in Kepler data

I. The method developed for Kepler

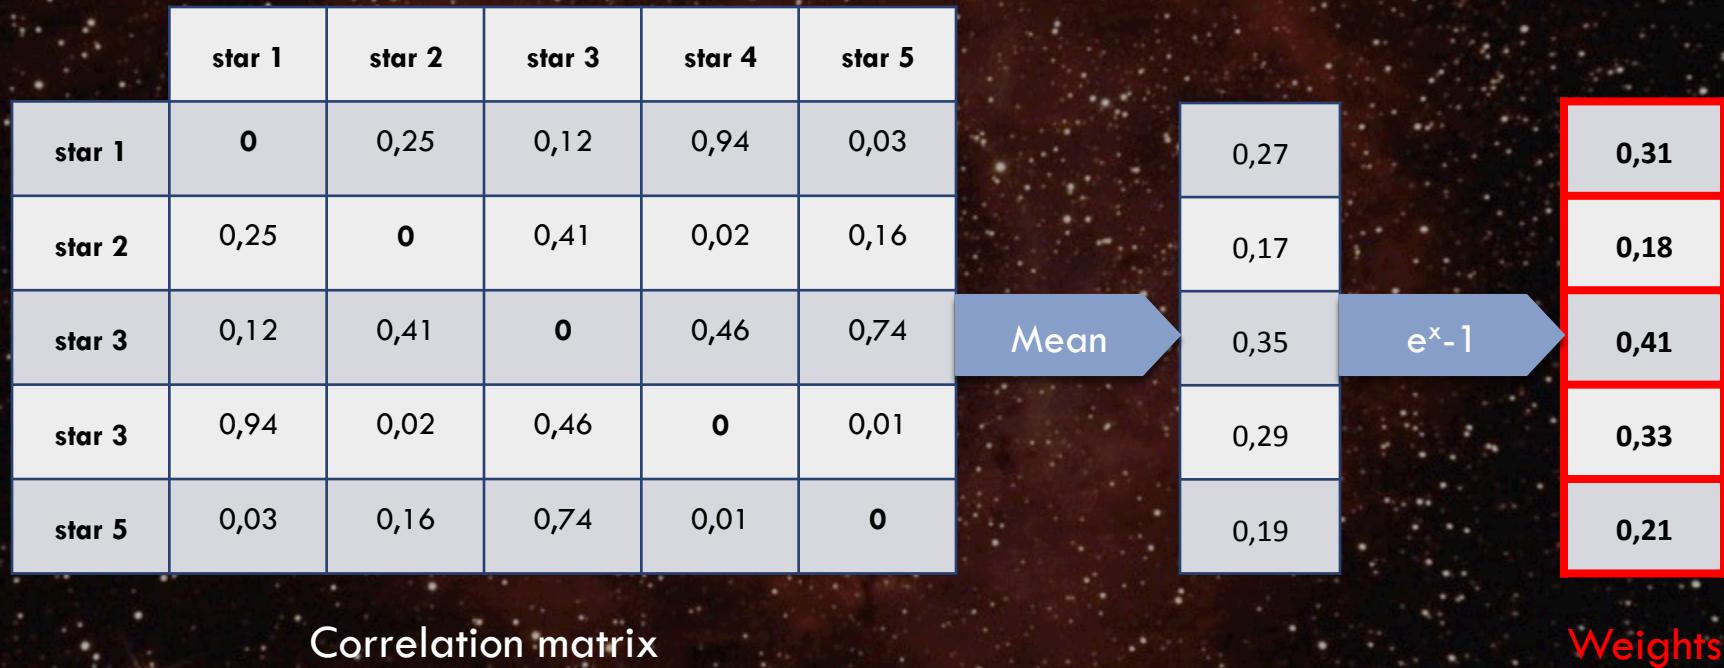

- Divide the data according to the module

4	3	8	7	12	11
2		3		4	
1	2	5	6	9	10
15	14	20	19	24	23
6		7		8	
16	13	17	18	21	22
35	34	39	38	43	42
				45	48
11		12		13	
36	33	40	37	44	41
				46	47
55	54	59	58	62	61
				66	65
16		17		18	
56	53	60	57	63	64
				67	68
74	73	78	77	82	81
				22	23
22		23		24	
75	76	79	80	83	84

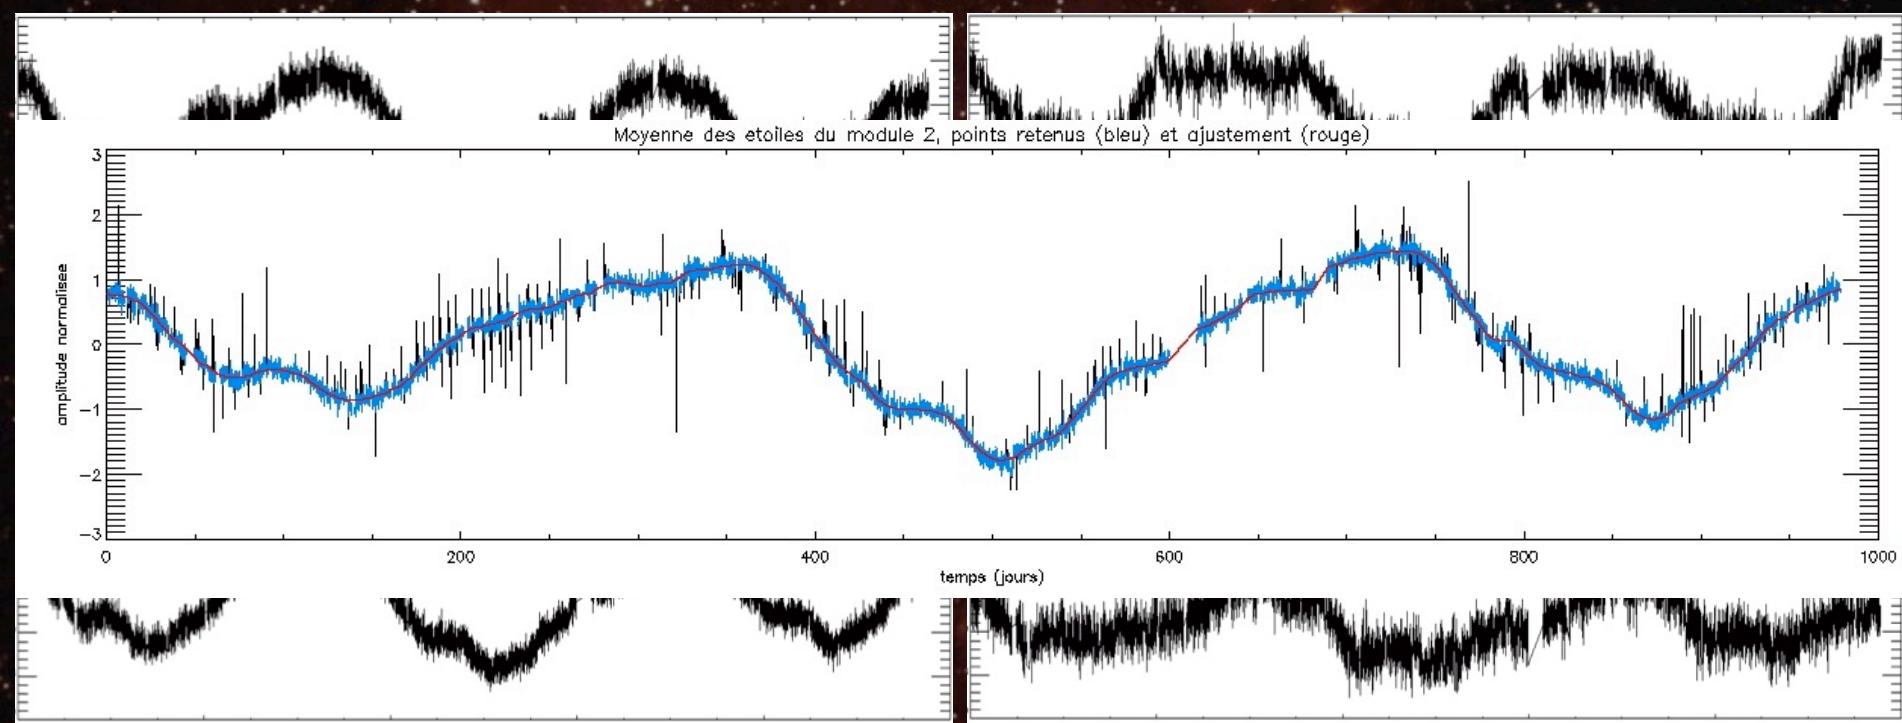

I. The method developed for Kepler

- Weighing lightcurves to calculate the global tendency

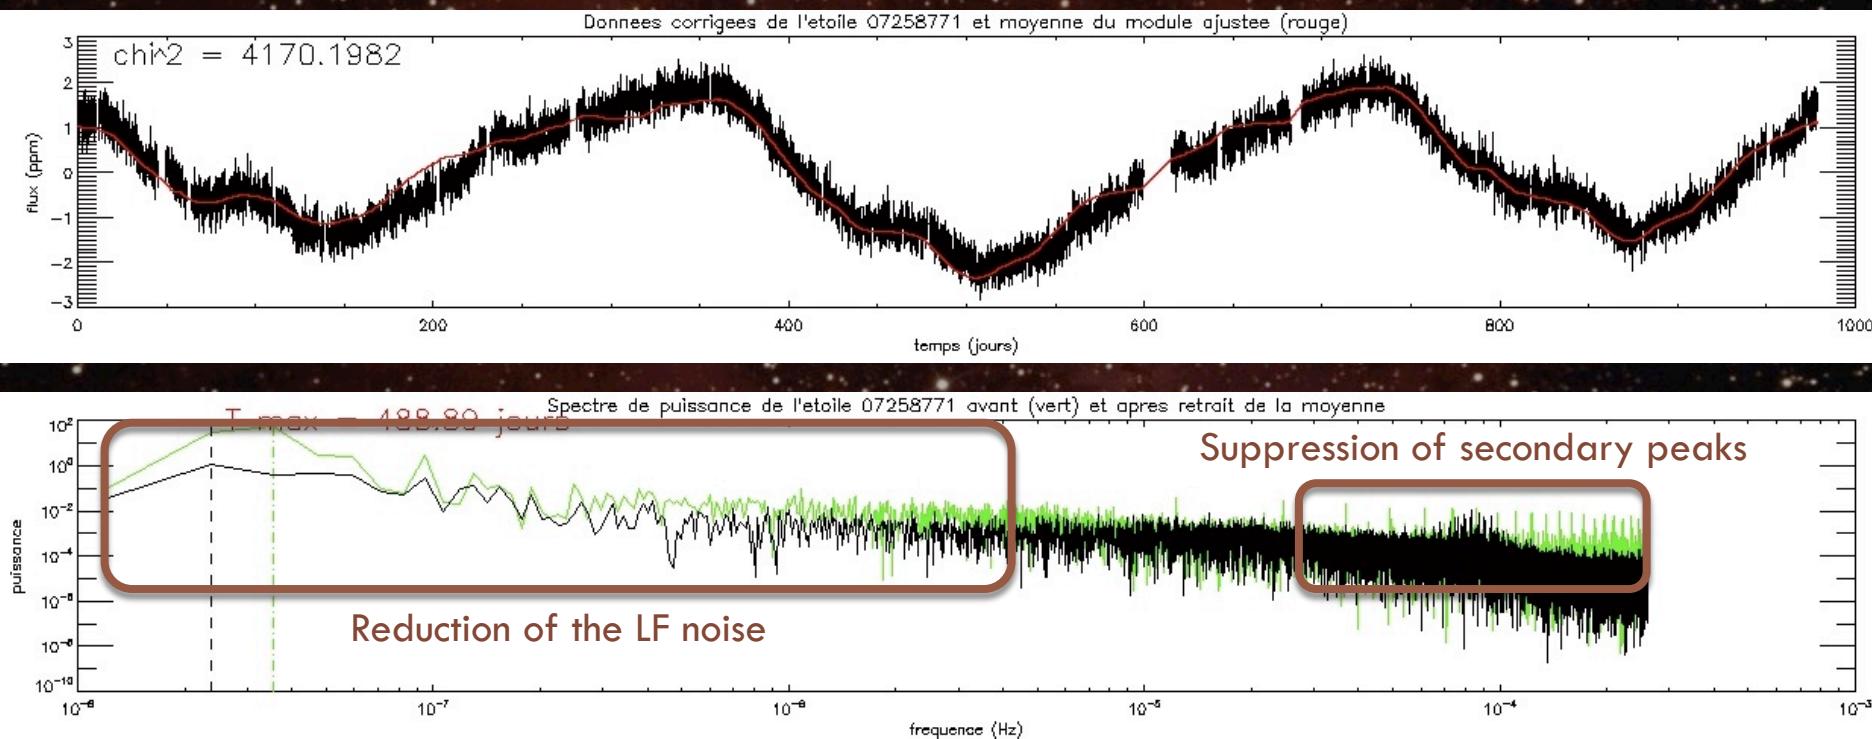

I. The method developed for Kepler

□ Obtained tendency for a module

I. The method developed for Kepler

- Substracting the obtained tendency from the lightcurves

II.

First test with CoRoT data

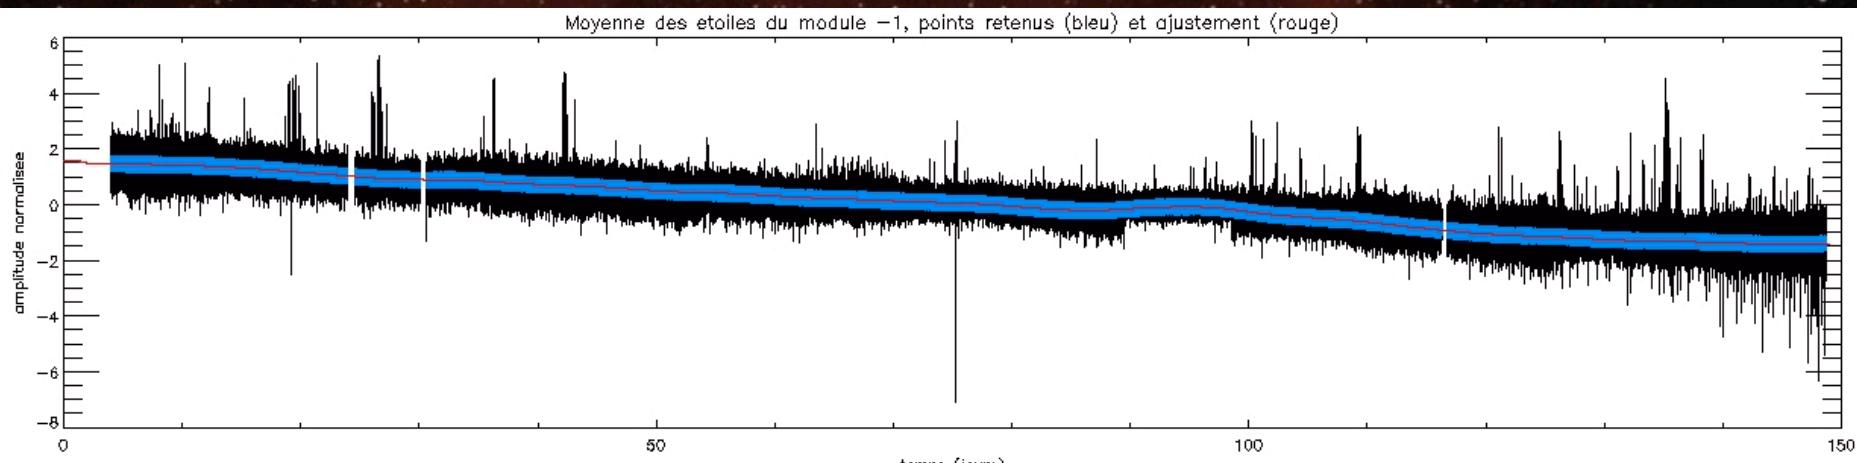

- ◆ Description of the sample
- ◆ Outputs of the method
- ◆ Assessing the modifications induced

II. First test with CoRoT data

- Sample of lightcurves from the ExoField
 - 100 stars
 - Raw lightcurves (N2)
 - No particular selection

II. First test with CoRoT data

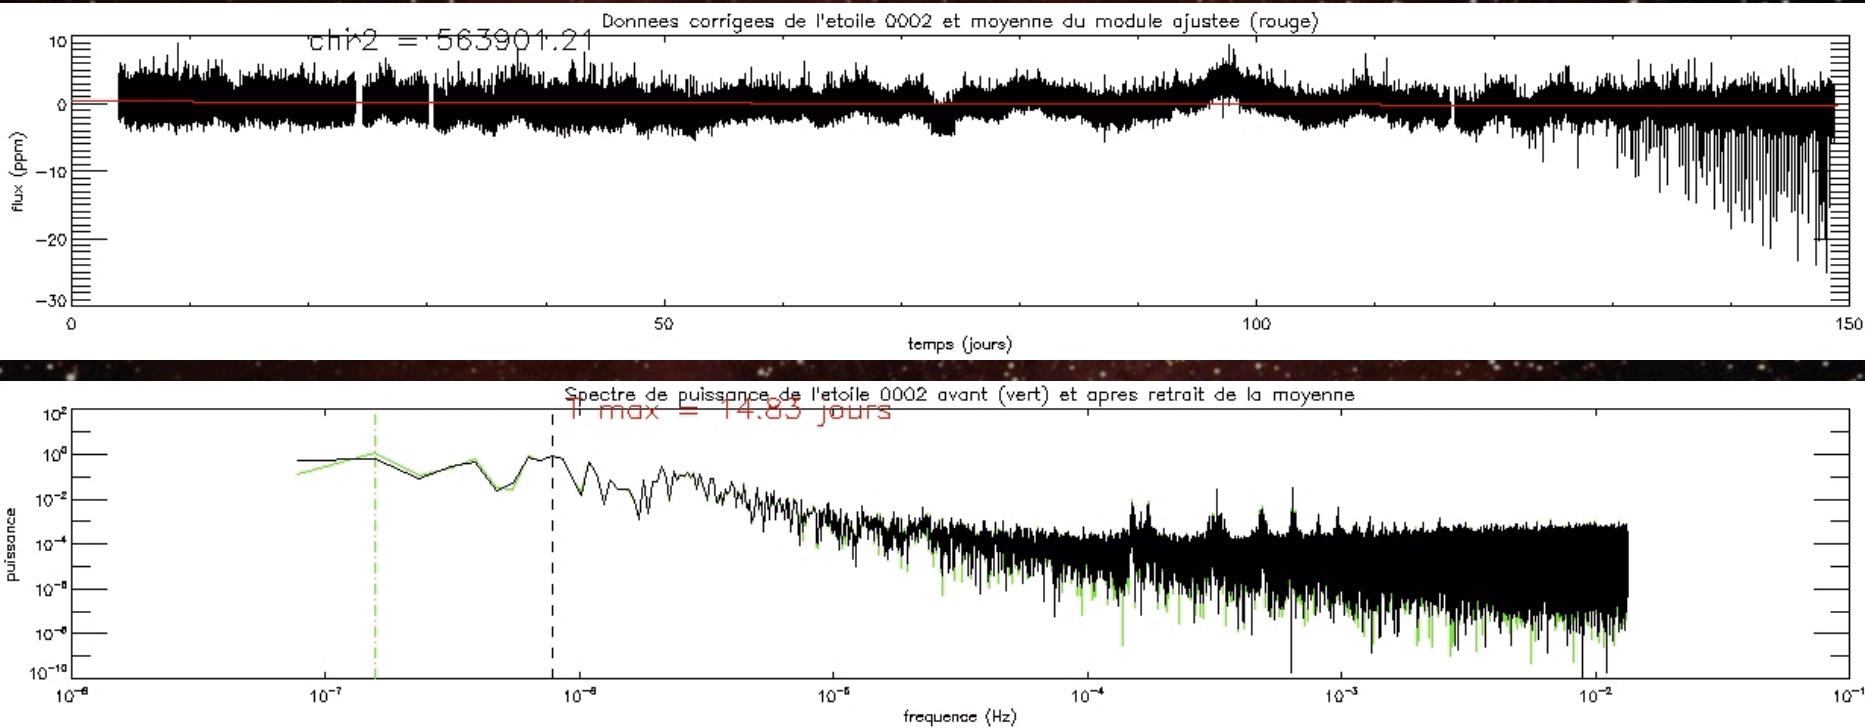

- Treating the whole sample as "one module"

Obtained global tendency

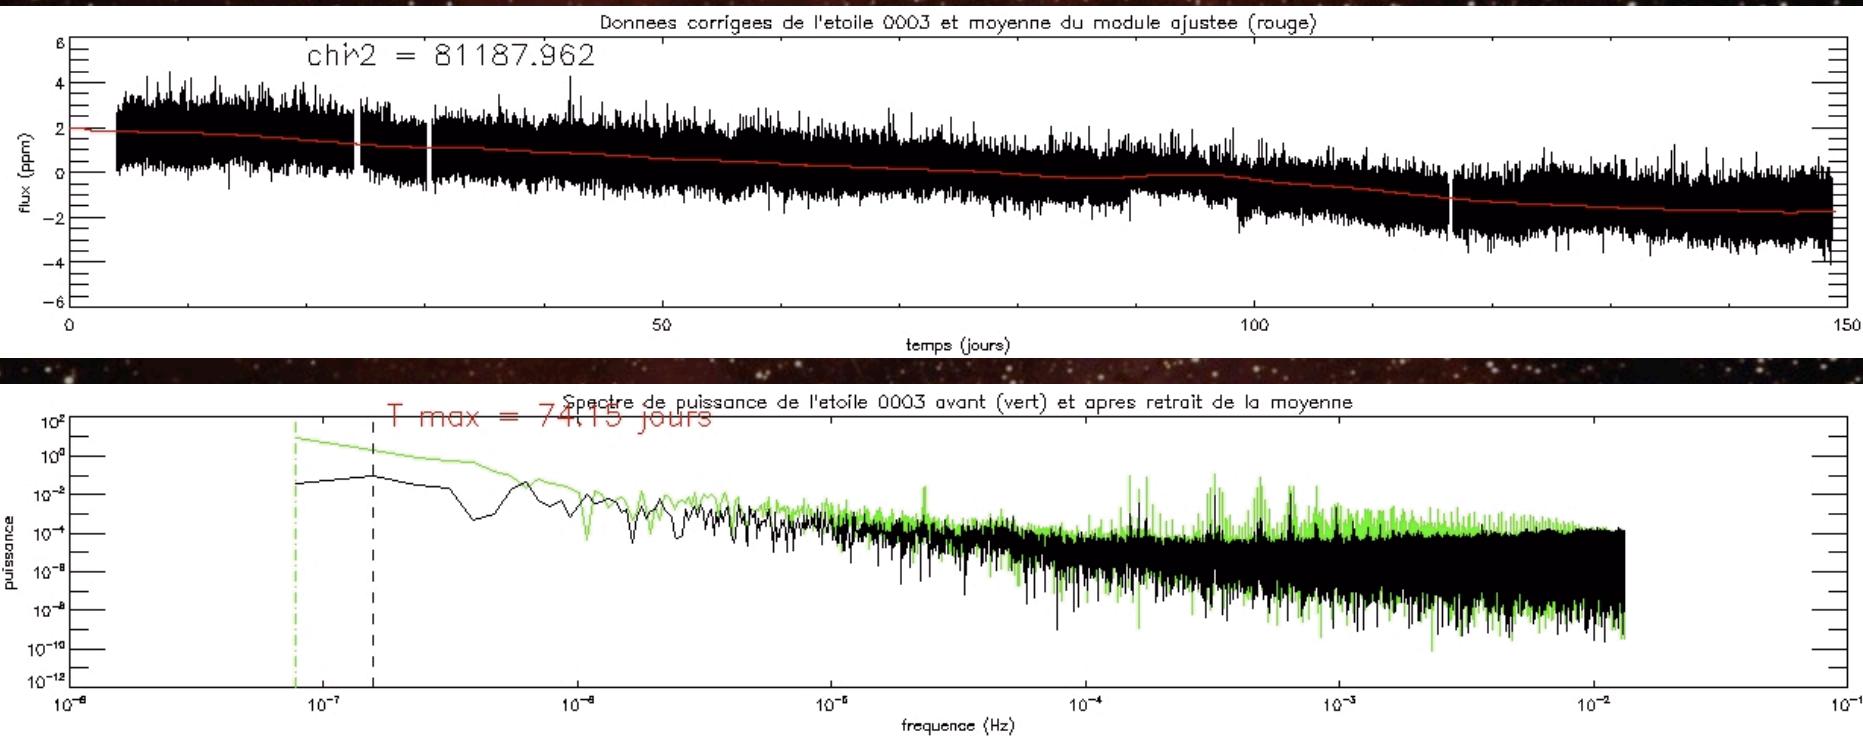

II. First test with CoRoT data

□ Effects on the lightcurves

II. First test with CoRoT data

□ Effects on the lightcurves

II. First test with CoRoT data

- Resulting lightcurves
 - Lower LF noise for most cases ($> 60\%$)
 - Diminution of HF noise
 - Effect of the same magnitude as a linear fit correction
BUT: calculated tendency much richer than the linear fit

II. First test with CoRoT data

- Improving the method
- Divide CoRoT's CCD into smaller areas ("modules")
- Correct jumps in the lightcurves
- Adapt the method's parameters to CoRoT lightcurves

Conclusion

- ◆ A statistical method to extract global tendencies
- ◆ Signal from the star conserved
- ◆ Encouraging first results for CoRoT
- ◆ Possibilities to improve the method

QUESTIONS ?

Correcting jumps

- Method developed by R. García & S. Mathur
