

# Physical Properties of Asteroid Surfaces

Karri Muinonen<sup>1,2</sup>

Professor of Planetary Astronomy & Geodesy

<sup>1</sup>Department of Physics, University of Helsinki, Finland

<sup>2</sup>Finnish Geospatial Research Institute (FGI), Masala, Finland

**Acknowledging:** Johannes Markkanen, Antti Penttilä, Ivan Kassamakov, Jouni Peltoniemi, Timo Väisänen, Anne Virkki, Olli Wilkman, Julia Martikainen, Tuomo Rossi, Edward Haeggström, Gorden Videen, Michael Mishchenko, Daniel Mackowski

XXVIII Canary Islands Winter School of Astrophysics, Solar System Exploration, La Laguna, Tenerife (Spain) Finland, November 7-16, 2016

# Lectures

1. Introduction to asteroid UV-VIS-NIR spectrometry,

Monday, November 7, 2016

2. Novel spectrometric modeling,

Tuesday, November 8, 2016

3. Hands-on application to asteroid observations,

Monday, November 14, 2016

4. Combining spectrometric, polarimetric, and photometric observations,

Monday, November 14, 2016

# Lecture 4, Contents

- Introduction
- Laboratory measurements
  - IAA Cosmic Dust Laboratory
  - Scattering by volcanic particles
  - Scattering by olivine and meteorite particles
- Scattering by Gaussian particles
- Feldspar as agglomerated debris
- Multiple scattering by a feldspar medium
- Application to asteroids
- Laboratory measurements
  - UH-Physics Scattering Laboratory
- Optical Constants How-To
- Conclusions

## **Acknowledgments:**

ERC Advanced Grant No 320773 SAEMPL

Academy of Finland Contract No 257966

# Introduction

- Physical characterization of **small particles and particulate media in asteroid surfaces**
- **Direct problem** of light scattering with varying **particle size, shape** (structure), and **refractive index** (optical properties)
- **Inverse problem** of retrieving physical properties of particles based on **observations/measurements**
- Plane of scattering, scattering angle, **solar phase angle**, degree of linear polarization

# IAA Cosmic Dust Laboratory

- Complete scattering matrix as a function of the scattering angle of aerosol particles
- Wavelengths of 483, 488, 520, 568, or 647 nm
- Scattering angle range from 3 to 177 degrees
- Munoz et al. 2010, JQSRT

# Scattering by Gaussian spheres

- Radial distance lognormal, size described by mean distance
- Logarithm of distance Gaussian and given in spherical harmonics (Muinonen et al., JQSRT 1996)
- Correlation between two logarithmic distances depends on the angular distance and is given as series of Legendre polynomials
- Variance of radial distance ( $\sigma^2$ ) controls the mountain heights and valley depths
- Power-law correlation function (Legendre coefficients proportional to  $l^{-\nu}$  where  $l$  is degree) results in only two shape parameters: **power-law index  $\nu$  and standard deviation of radial distance  $\sigma$**

- Simulations with the Discrete-Dipole Approximation (DDA; Muinonen et al. 2007, Zubko et al. 2008 & 2003)
- Radial-distance standard deviations 0.05, 0.10, 0.15, 0.20, 0.245; power-law index 4.0
- Refractive indices  $1.6+i0.0005$  (silicates) and 1.313 (ice)

# Scattering theory

Stokes vectors

$$\mathbf{I}_i = (I_i, Q_i, U_i, V_i)^T$$
$$\mathbf{I}_s = (I_s, Q_s, U_s, V_s)^T$$

scattering matrix  $\mathbf{S}$

$$\mathbf{I}_s = \frac{1}{k^2 R^2} \mathbf{S} \cdot \mathbf{I}_i$$

$$I_{\parallel}(\theta) = S_{11}(\theta) + S_{12}(\theta),$$

$$I_{\perp}(\theta) = S_{11}(\theta) - S_{12}(\theta),$$

$$P(\theta) = -\frac{S_{12}(\theta)}{S_{11}(\theta)},$$

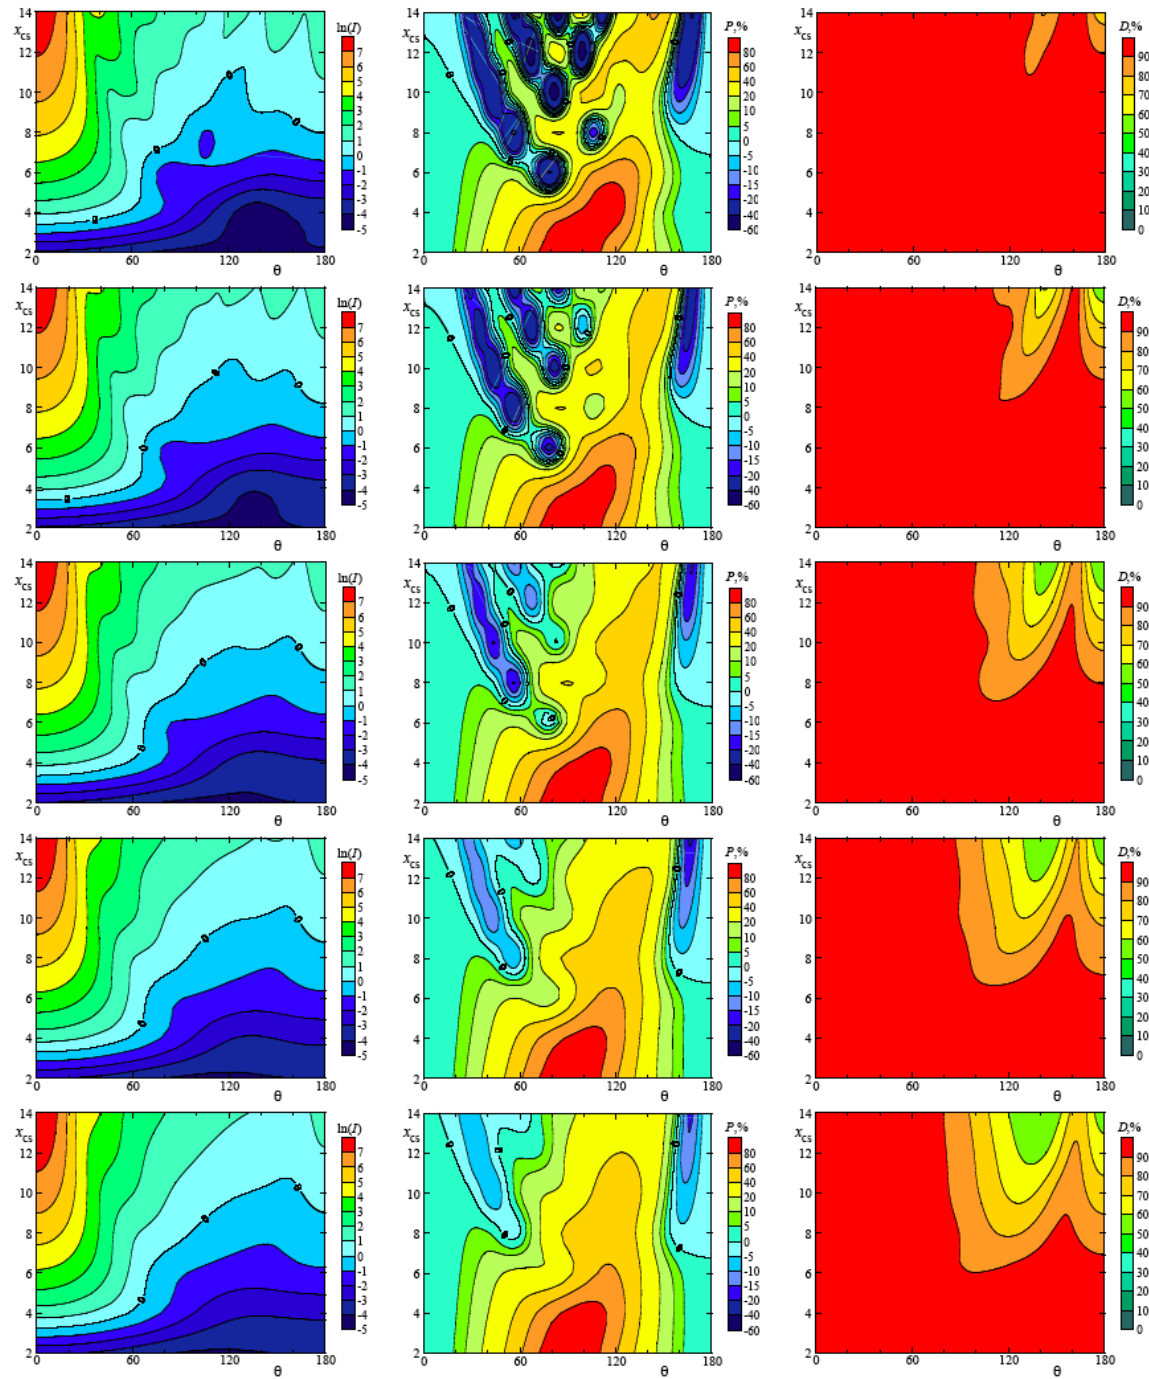

$$D(\theta) = 1 - \frac{S_{22}(\theta)}{S_{11}(\theta)},$$

where  $\theta$  is the scattering angle.

1.313

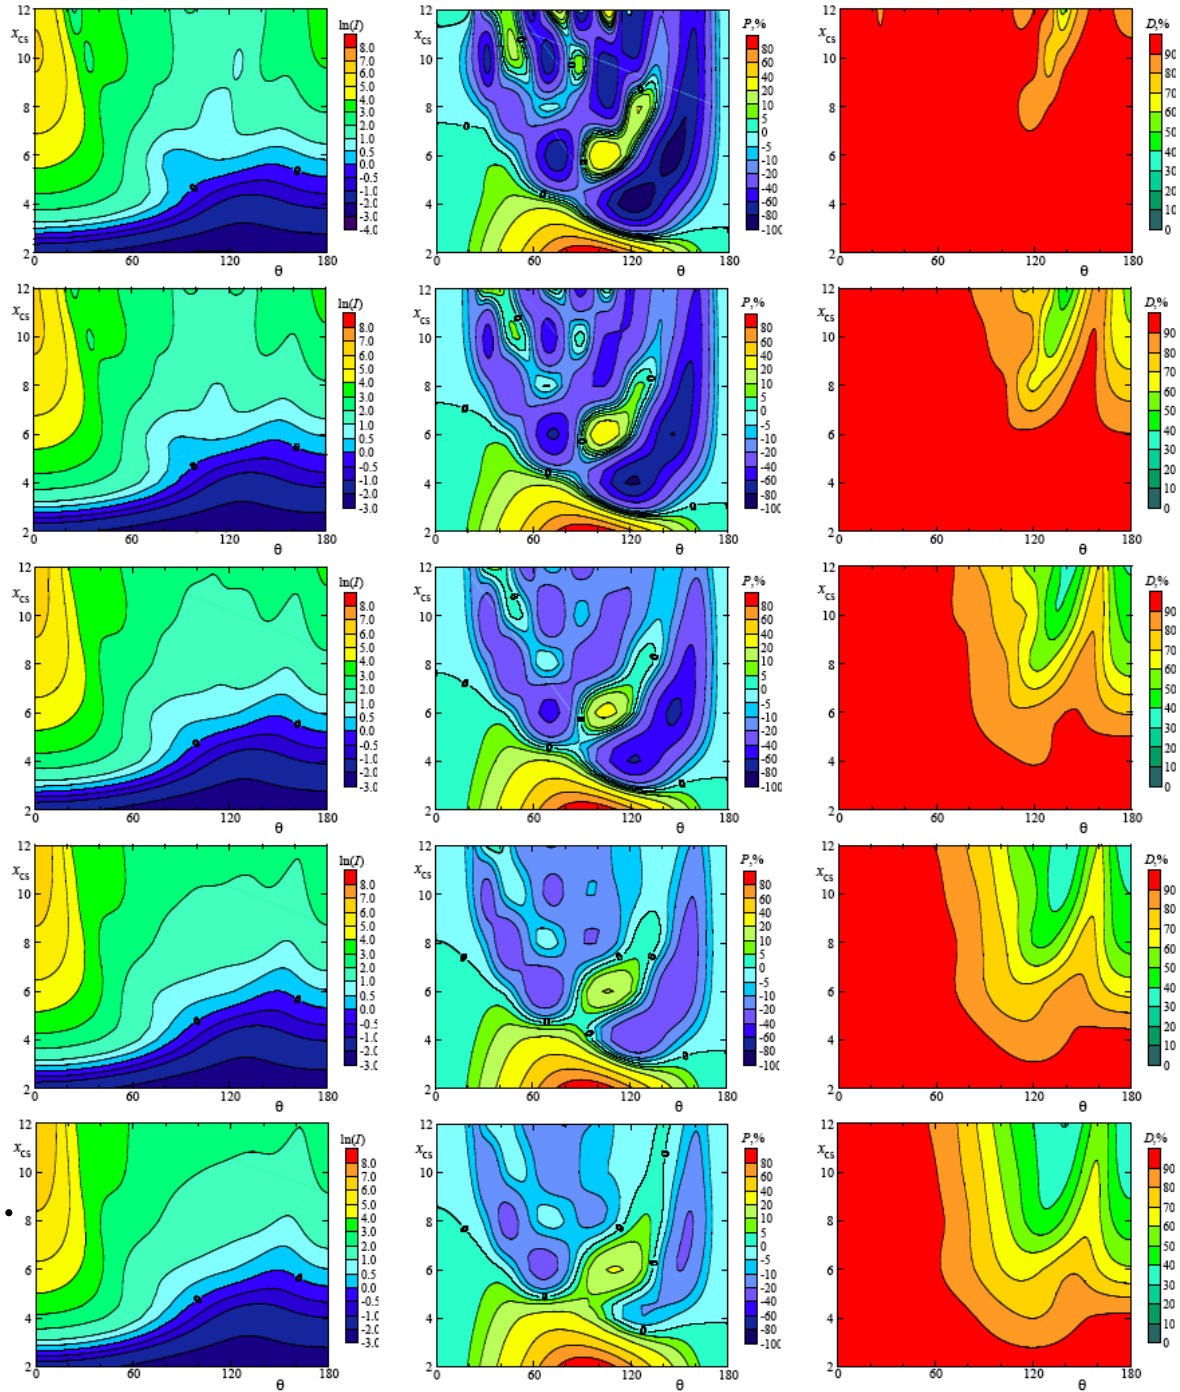

Qualitative  
explanations?  
See Muinonen  
et al. 2011.

1.6+i0.0005

Qualitative explanations?  
See Muinonen et al. 2011.

Tyynelä et al. 2007 & 2008,  
Lindqvist et al. 2009

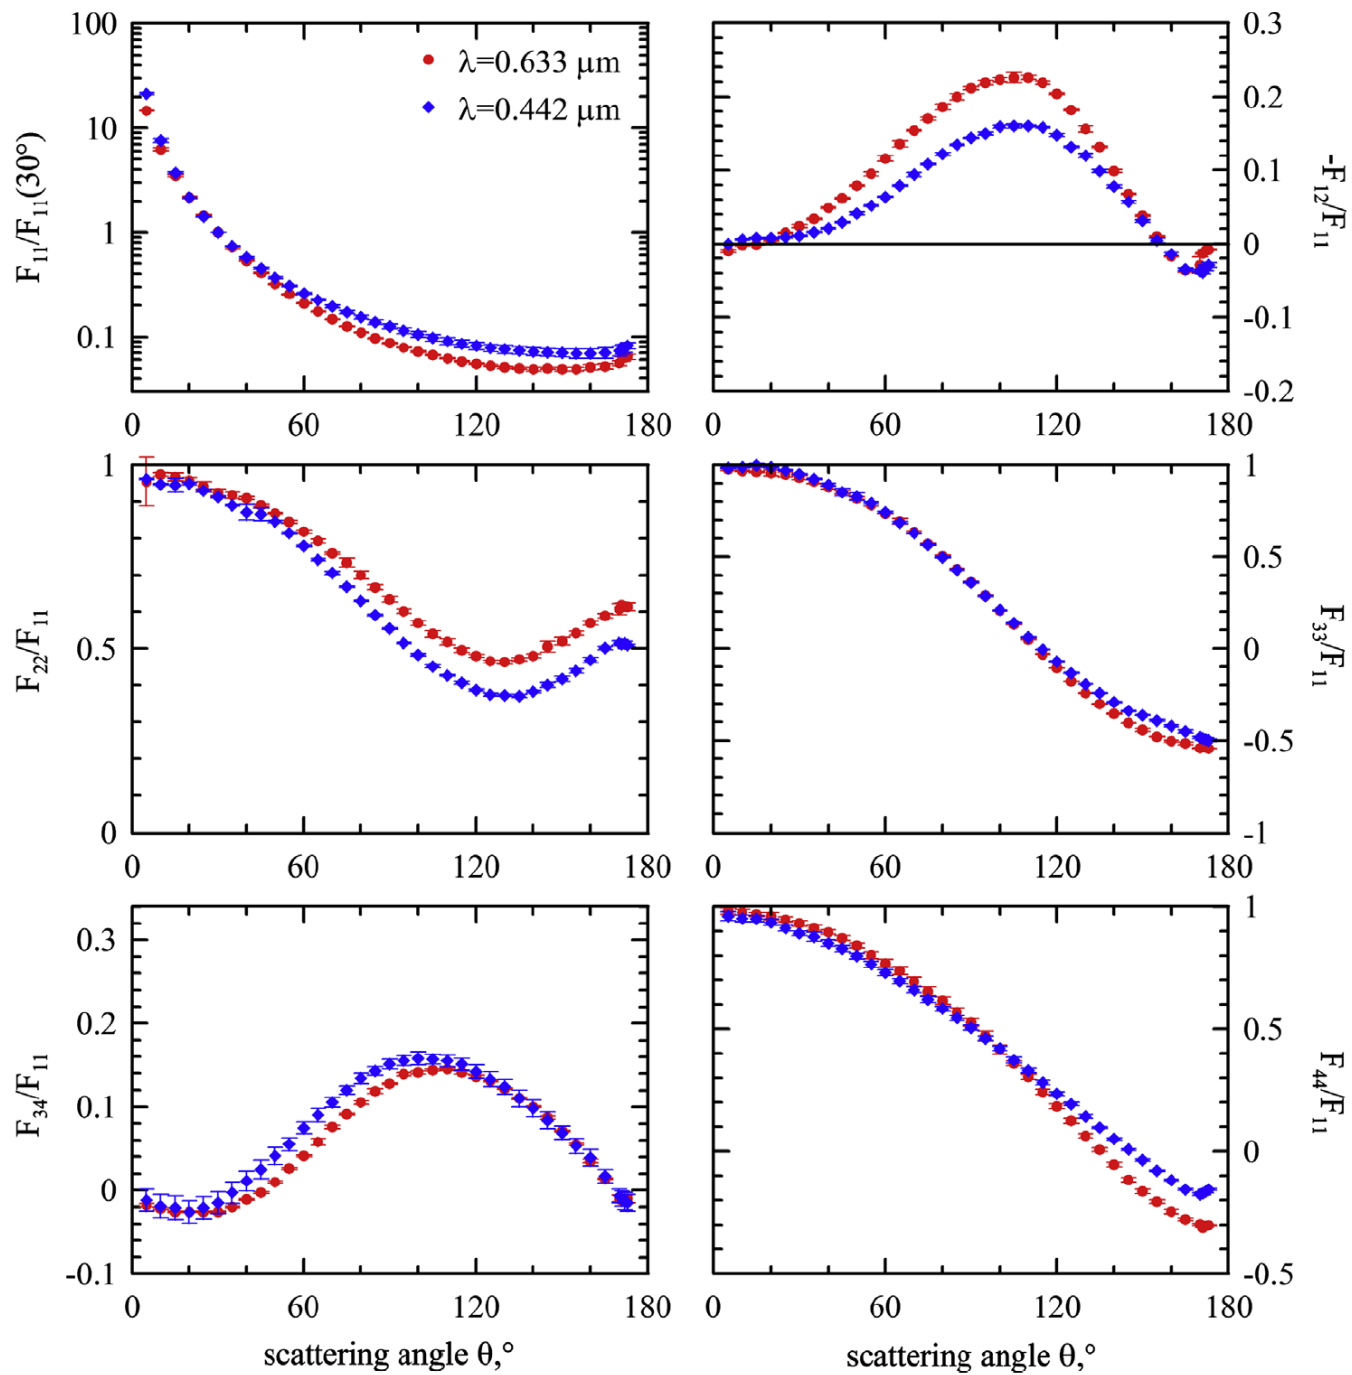

# Feldspar as agglomerated debris

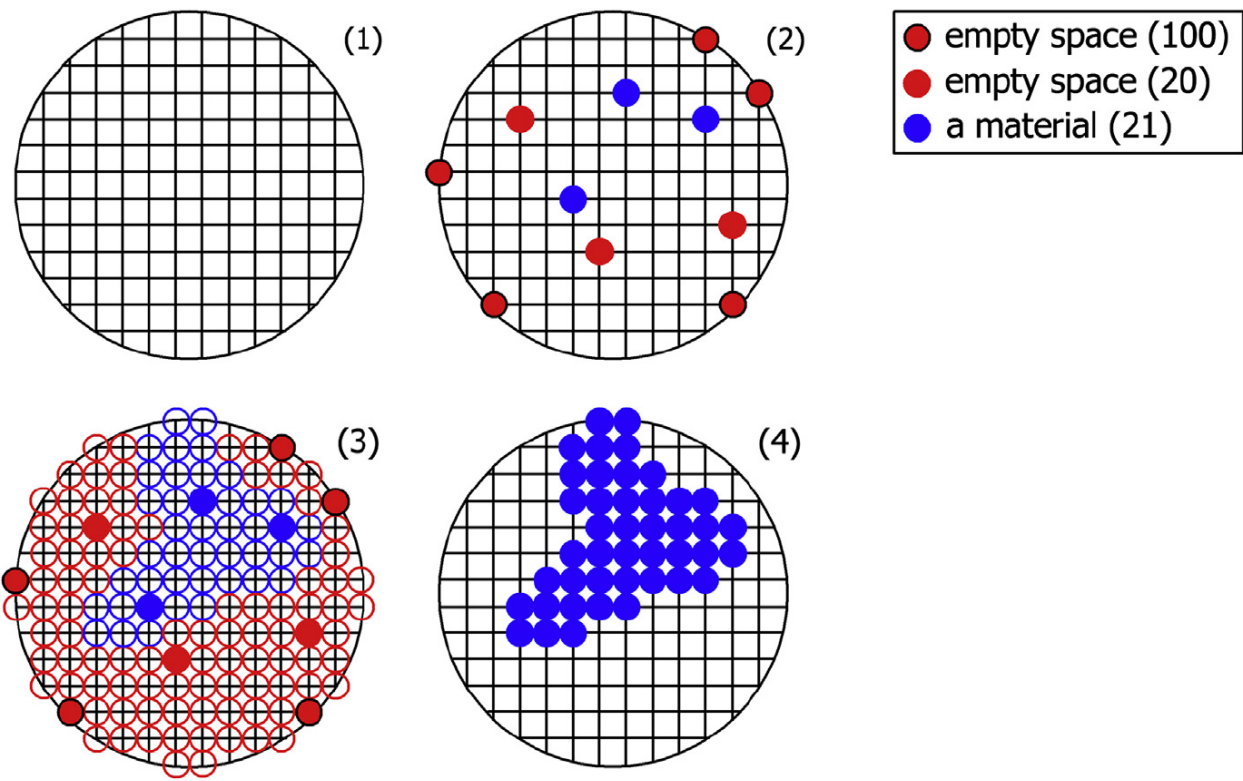

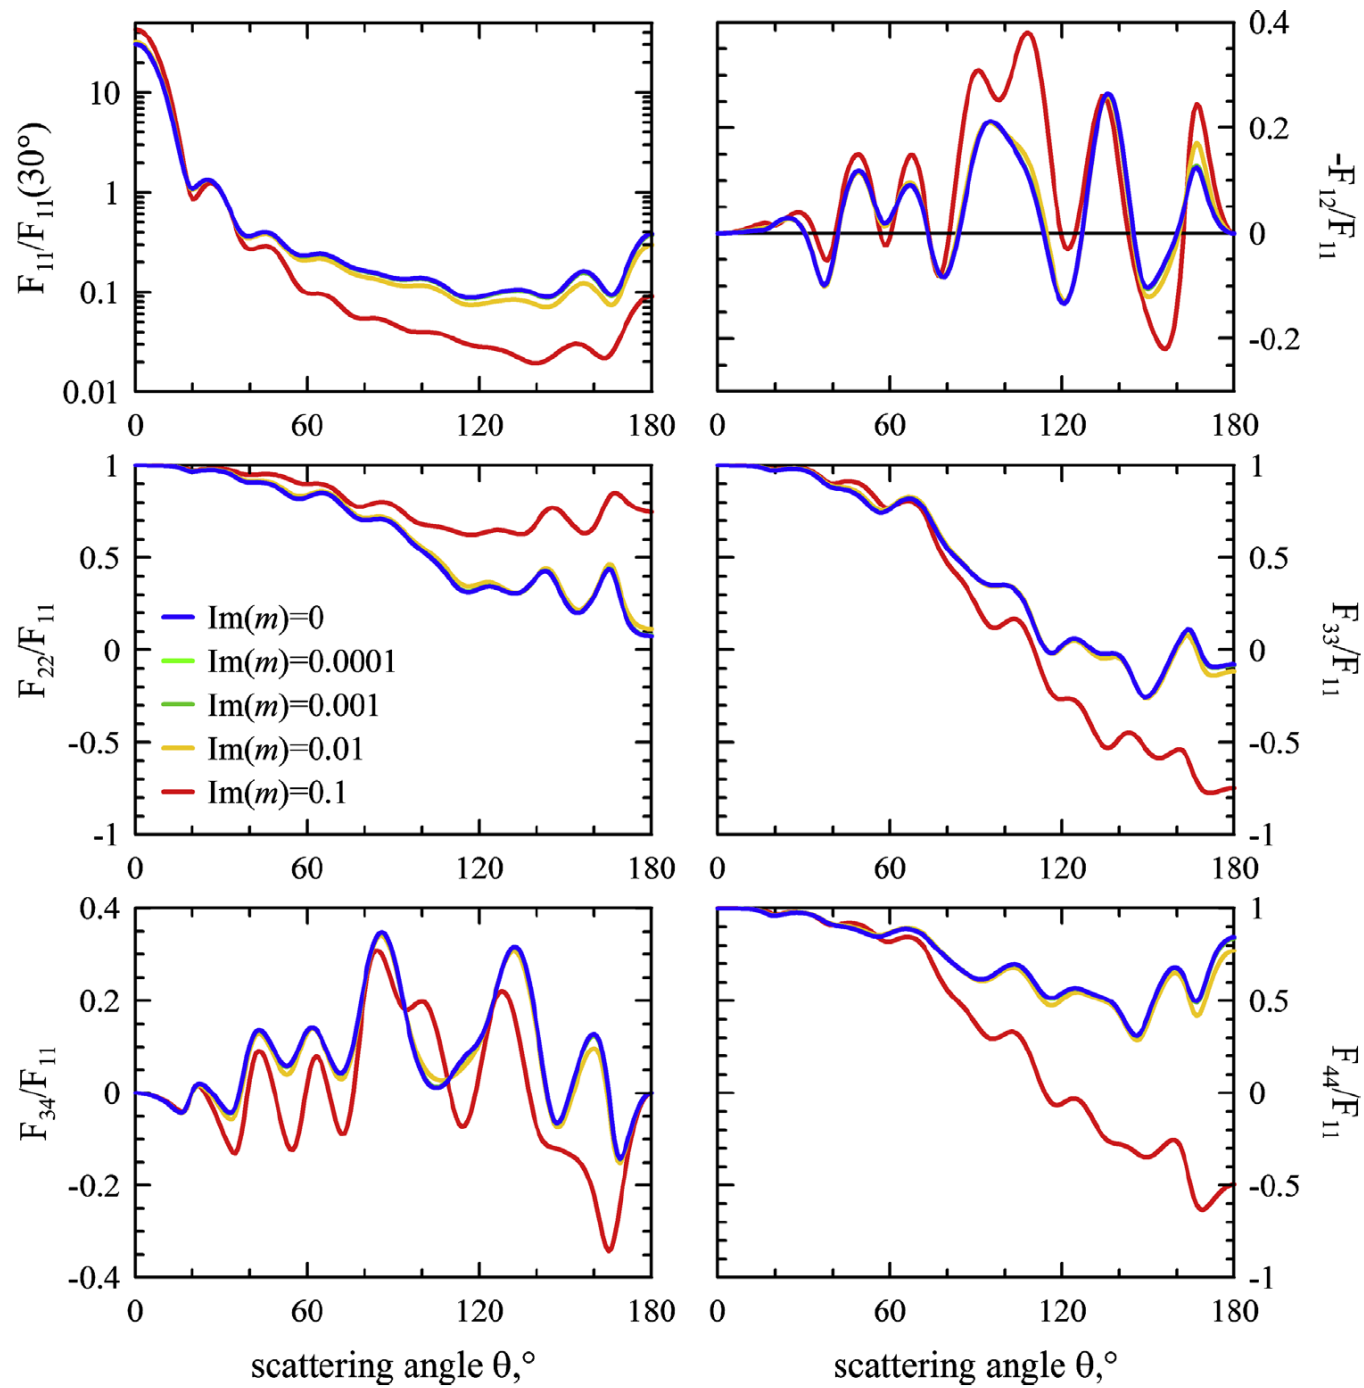

Zubko et al., JQSRT, 2013

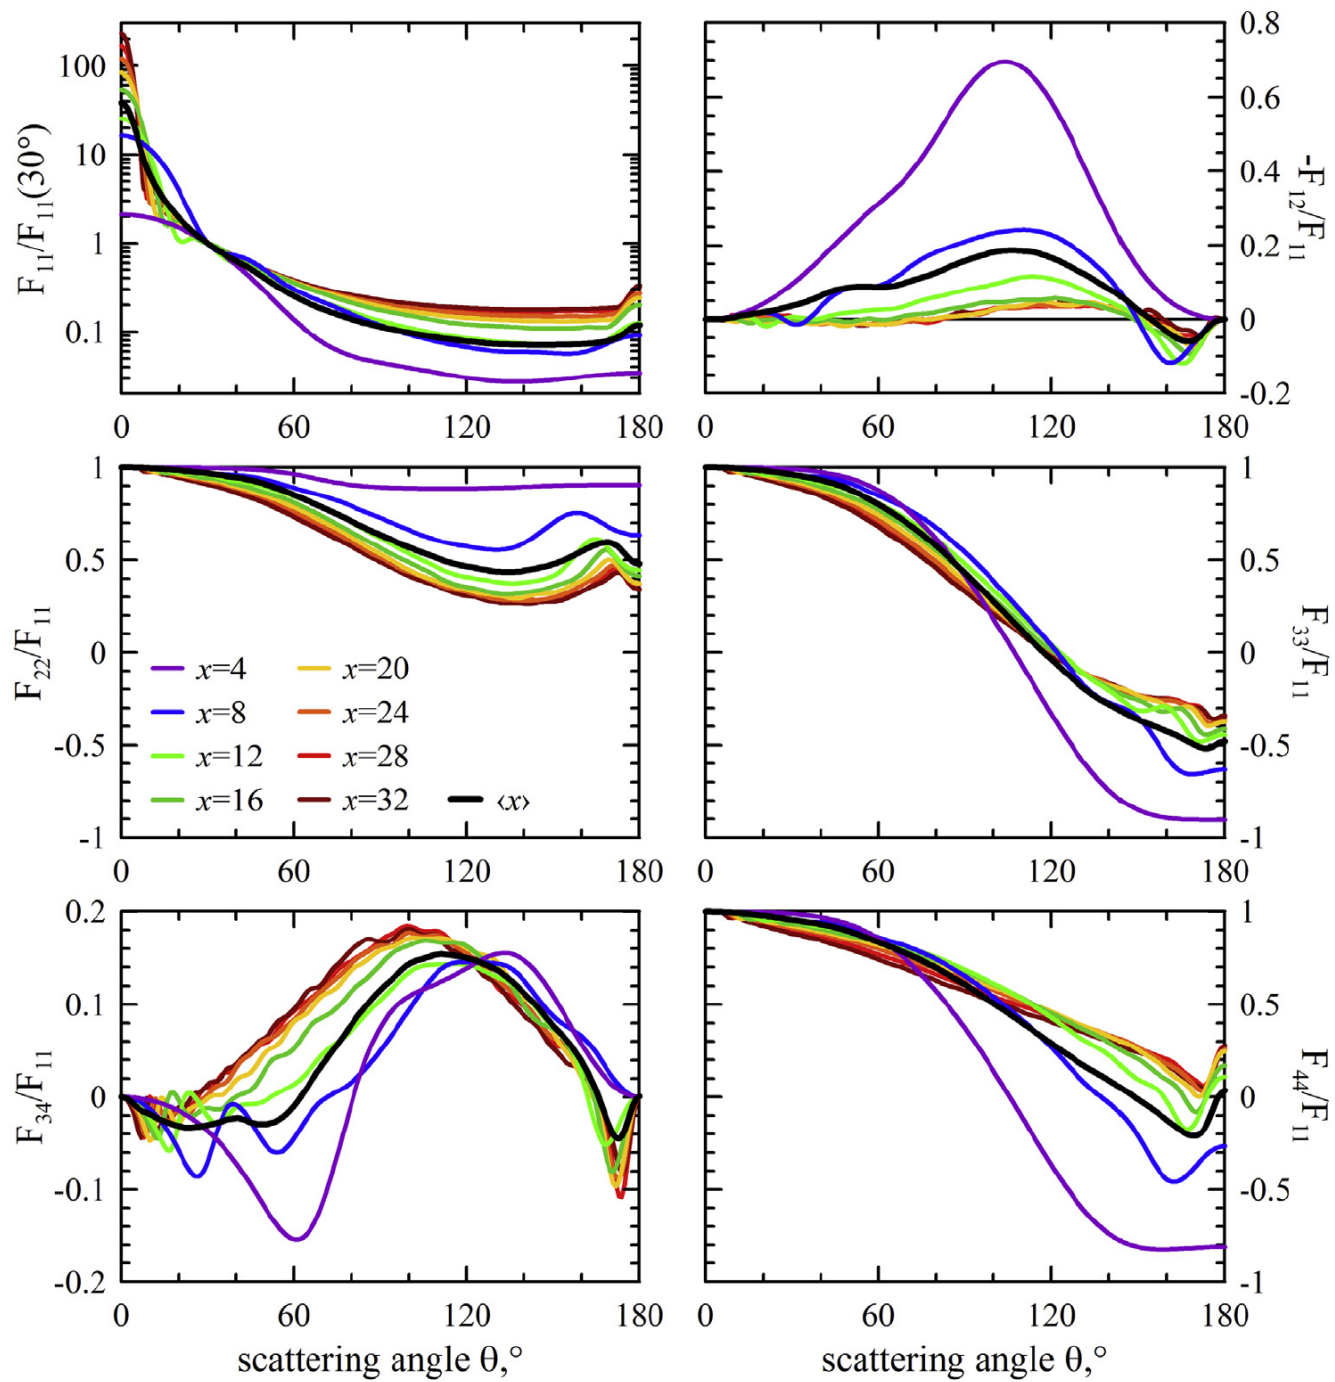

# Multiple scattering by a medium of feldspar particles

Laboratory measurements for feldspar particles:

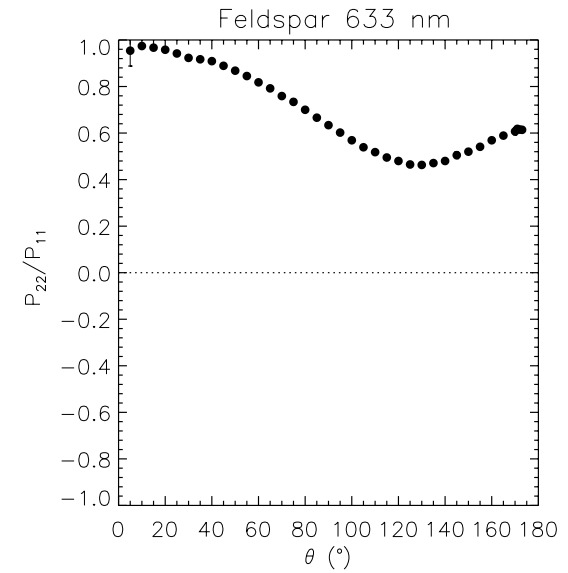

**Single scattering:** Volten et al. 2001, Munoz et al. 2012

**Multiple scattering:** Shkuratov et al. 2004

# Feldspar at 442 nm

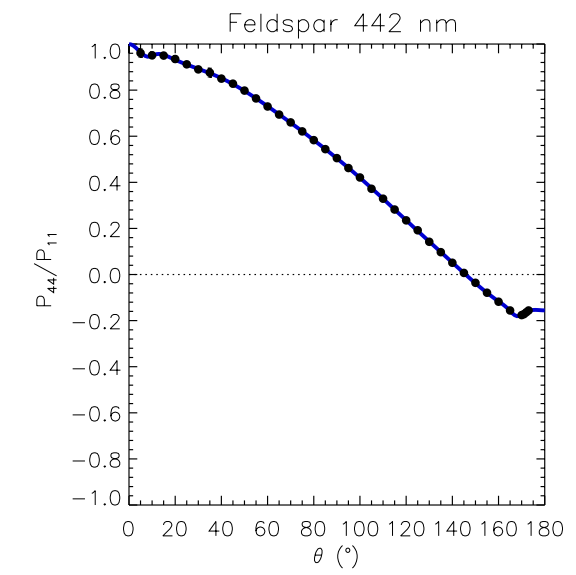

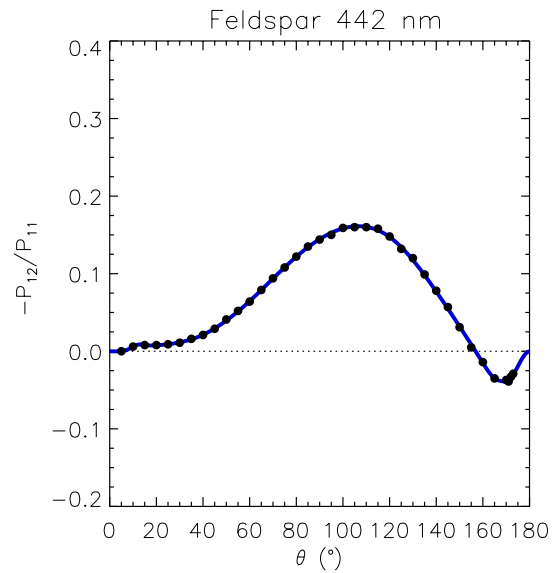

# Feldspar at 633 nm

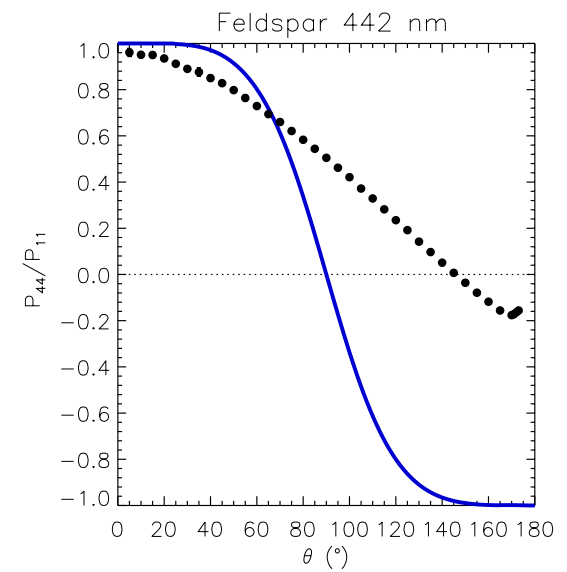

# Feldspar scattering matrix model

- Feldspar particle scattering matrix modeled using interacting phenomenological fundamental scatterers
- Three phenomenological components expressed using splines:
  - Forward scatterer
  - Positively linearly polarizing scatterer
  - Negatively linearly polarizing scatterer
- Conjugate gradient optimization with splines (future)
- Ultimate goal: spectropolarimetric modeling

# Feldspar at 442 nm

# Feldspar at 442 nm

# Feldspar at 633 nm

# Feldspar at 633 nm

# Feldspar at 442 nm

# Feldspar at 633 nm

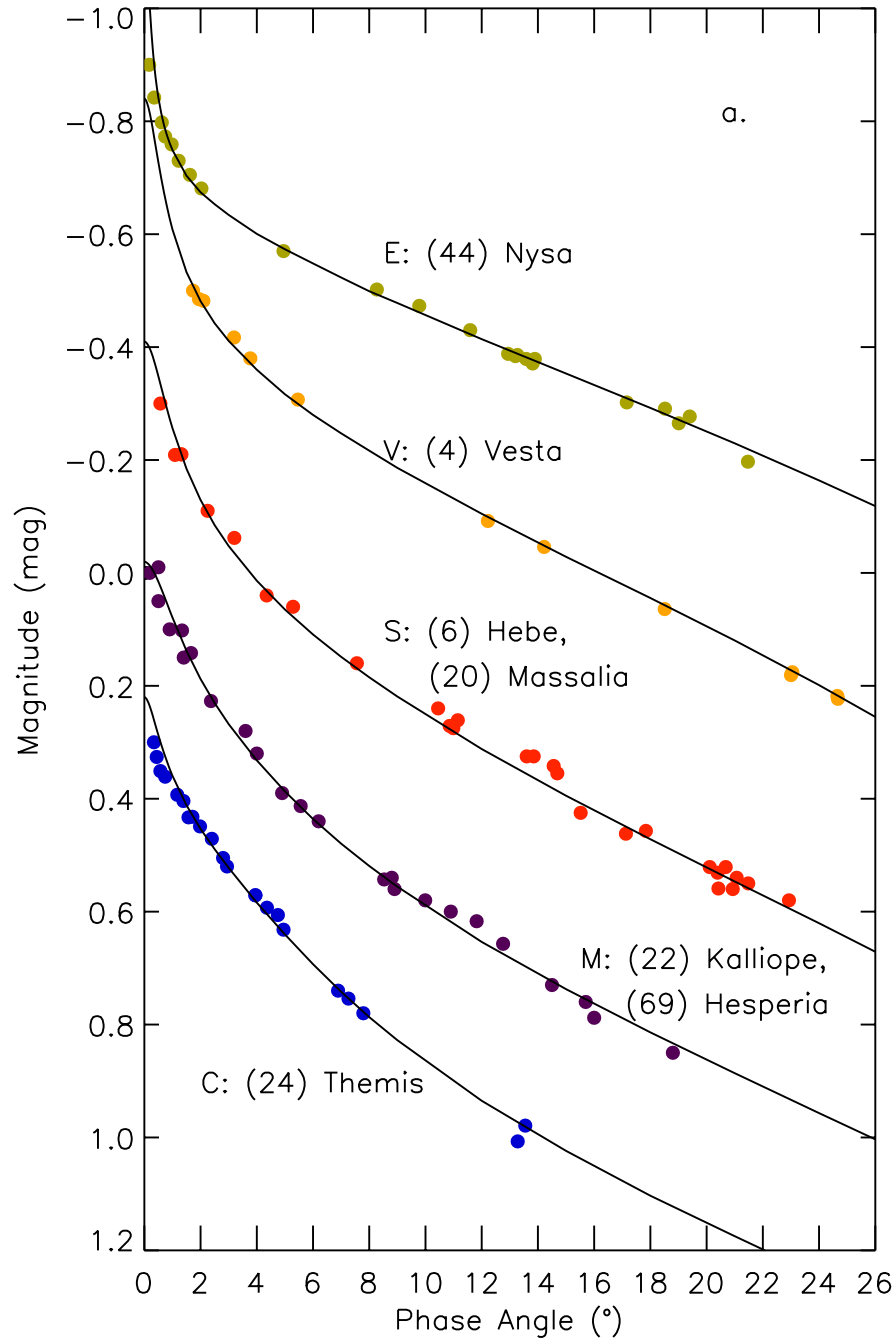

# Application to asteroids

Laboratory  
Measurements:  
Volten et al. 2001,  
Munoz et al. 2012

Theoretical modeling:  
Muinonen et al.,  
in preparation

Spherical volume of  
scatterers, geometric  
albedo matched  
with the observed one

Shadowing assumed linear  
in brightness

Theoretical modeling:  
Muinonen et al.,  
in preparation

No shadowing effects

# UH-Physics Scattering Laboratory

- Scattering measurements for levitating particles with sizes  $10^1$ - $10^4$  microns
- Ultrasonic levitation and control of sample orientation
- Verification of numerical multiple scattering methods
- Alignment of optics and calibration measurements ongoing
- National Instruments Young Scientist Prize in Northern Europe for Mr. Göran Maconi

**Fig. 1: Simplified schematic of the final setup**

**Fig. 2: Photograph of setup with prototype acoustic levitator installed**

**Fig. 3: Test measurement with a 3 mm glass sphere**

# Optical Constants How-To

- Measure the scattering matrix for a single particle in controlled orientation
- Measure the size, shape, and structure of the particle
- Using numerical methods, find the real part of the refractive index and constrain the imaginary part of the refractive index
- Increasing the sample size, find the imaginary part of the refractive index
- When necessary, move to consider semi-infinite layers of particles

# Conclusions

- RT-CB with **phenomenological scatterers** explains the photometric and polarimetric observations of asteroids
- **Depolarizing scatterers** successfully incorporated into RT-CB
- **Regolith geometry** to be accounted for, including shadowing effects

- **Interactions** among scatterers to be accounted for **exactly** (SAEMPL R<sup>2</sup>T<sup>2</sup>)
- Multiple-scattering modeling for **large atmospheric particles**
- **Scattering laboratory** for levitating particles ( $10^0$ - $10^4$  microns) in fixed orientation (first measurements in 2016)
